Advantages: Size - Measuring approximately 4 3/4 x 2 5/8 x 1, you can take this little mini anywhere! Even slip it into your shirt pocket!
SW bands - Covers 9 SW bands: 49m, 41m, 31m, 25m, 21m, 19m and 16m.
MW, FM, FM Stereo (thru headphones)
Travel Power lock
Push button control
Runs on two AA batteries or AC adapter
Travel pouch
Carrying strap

Disadvantages: It's an analog unit, guys and gals, no digital display.
No back stand
Antenna does not rotate up

I've had a lot of fun with this little receiver. The SW sensitivity is quite good for my area of the country, Cleveland, Ohio. The speaker has a nice sound and improves thru the earphones. FM stereo thru headphones is great! MW DXing is surprisingly good! I can grab signals from Boston, Chicago, New York and Cincinnati much better than on my Magnavox AE 3625 Digital!

Summary: A nice little travel radio that's fun to fiddle with or take for travel when you're in a pinch. Radio Shack has discontinued this model so you might be able to find it on sale for around $50.00. I love the size! Ideal for travel! I'm

beginning to think that anything larger is too
cumbersome. I do miss the Digital Display and all the
features that go with it: Freq. display, Alarms,
world time display, etc. If I were buying today, though,
I'd consider what else is out there for just a bit more
money. For example, the new Sangean 606 is only
slightly larger and has all the digital features mentioned above that I miss. I
've seen it priced for as little as
$179.95!

****
Realistic DX-350 - 1

I bought this radio when I first started out in shortwave listening
because it was the cheapest thing at Radio Shack. I think I paid $60
for, but I'm pretty sure the price has gone down since then.

Nowadays I mostly use it as my travel radio. Sesnitivity is okay for the
price, but not too great. When I'm at home (western US) I can pick up
the major international broadcasters, but no too much else. On my trips
back East, I've found sensitivity picks up some, but it's still only
fair.

Performance on the AM and FM bands is average, but longwave seems to be
nearly useless. I've never heard any nav beacons on this one, even
though there are several near my house.

Radio Shack sells a reel antenna for about $8, and I picked one of these
up when I bought my radio. It helps reception a little, but not very
much. A much better solution is to wrap a stripped end of a wire around
the the whip antenna, and attach the other end to a metal windowframe.
I've tried connecting my longwire to it, but that just overloads the
receiver (not surprising).

One major problem that I've noted is that the dial markings on some
shortwave bands seem to be off by up to 10 kHz. If you know about it,
it's not much of a problem to work around, but initially it could be
quite confusing.

Overall, this receiver is average for its price. There's no real
surprises, either good or bad. If you really want an inexpensive radio,
go for this one. Otherwise, I would advise saving your money and going
for an inexpensive digital radio.

****
Realistic DX-375 - 1

It costs $99.99 though I got it for $89 since I had a coupon for a
rebate. For the price I think I got a good deal. It has digital tuning
and direct input of frequencies which allows tuning to be a pretty
simple job and not a time consuming act of patience. It uses two C type
batteries... I use rechargable ones and they last a pretty long time..

It is not small enough to carry in your shirt pocket but it could fit in the front or side pocket of an average sized backpack. It is just great when you are walking back home from school/work ... it can be easily carried in one hand as you catch up on the news from BBC/Deutschewelle/Radio Australia/etc.... as you walk home..
I get decent reception of all the `big stations' even indoors and have, on occasion also been able to tune to Radio UAE....

The sleep function is perfect for someone like me who likes to fall asleep with music... the FM sound is pretty good in stereo (headphones)... The AM reception is also fairly good but it has a very high tendency to catch those Bible bashing stations...probably a reflection of the region where I live...

The strap is a little shoddy and I have a feeling I may have to `fix it' soon... I expect it to pop out any moment....
Despite that, I like it...

****
Realistic DX-380 -2

I've owned a DX-380 for about 9 months now and....
It's a GREAT RADIO! However, I should qualify this. I bought it on sale from Radio Shack for the bargain price of $129.95! It regularly retails for $179.95. At $130.00, this radio is a real steal!

About the size of a large paperback book, the 380 is feature packed!

*DUAL CLOCKS
*ALARM WITH RADIO/BUZZER
*60 MINUTE SLEEP TIMER
*DUAL BANDWIDTHS
*DIRECT FREQ. ENTRY TUNING
*TUNING KNOB
*SLEW TUNING
*TUNES IN 1 OR 5 KHZ STEPS
*CLOCK DISPLAYED SEPARATELY
*BACKSTAND
*STEREO THRU HEADPHONES
*CONTINUOUS SW COVERAGE...NO GAPS!
*AUTO SCAN UP OR DOWN
*ANTENNA ROTATES AND SWIVELS
*CARRYING CASE

The sensitivity of this radio is GREAT! With a reel antenna, it's even better! I read another review that said reception was lousy....I think that individual should check his particular receiver as he might have the rare defective unit. MW reception is also outstanding and with a Slect-A-Tenna is greatly improved! Herein Cleveland, I pick up Chicago, Cincinnati, and Pittsburgh during the day WITHOUT the select-a-tenna! With the S-A-T reception gets an added boost!

(these are all 50,000 watt stations)

I have found it to be about the perfect travel size. I would like something smaller, like the 606. This size, however is fine. I've carried hardbound books on jets that are larger. The many features makes up for it's slightly larger size over a mini. It does not have SSB, but I really don't miss it.

All in all, A great radio priced at $130.00! I would not have bought it for the price of $179.95. There are other radios in that price range that ive ya more bang for the buck. At $130.00, it's a great deal! If you can get it at that price, snap it up!

I am by no means an expert, but I have a DX-380 and can give some of my experiences. First of all, I would pay the extra to get the 390 to get the single side band capability. I miss it. I miss it. Also, the sensitivity for foreign broadcasts (I'm in DC) without an external antenna is poor. You get the BBC and some German broadcast relays from Canada transmitters, some south american stuff, and that's it. BUT with a 50 m Cu wire out my 2nd story window attached to the antenna with an alligator clip, I regularly get Abu Dhabi and Australia at night.

****
Realistic DX-390 - 2

Great mid-sized digital portable. Good sensitivity and selectivity. Digital display shows time, frequency, signal strength, and memory location. Covers LW (in 9 kHz steps), MW (in 9 or 10 kHz steps) and SW continuously from 150 kHz to 30000 kHz. FM reception (88-108 MHz) with stereo through headphone jack. BFO control for SSB reception. Built-in timer/clock, 9 programmable memory locations per band, except 18 on SW. Good audio output. RF Gain and AM bandwidth controls. Keypad frequency entry. External antenna, AC-adapter inputs.

A great radio for the beginner or as an upgrade from a smaller and/or analog unit.

Purchased from Radio Shack for $219 in January, 1992.

I have a new Realistic DX-390 (alias Sangean 813??). Seems to be a great value for the price $169 US. I haven't yet heard from someone who can recommend a radio for the same price that is better, and can back it up with facts.

****
Grundig Satellit 700 - 3

Truly a world-class portable, digital receiver. Excellent sensitivity and selectivity. Digital display with two separate clock/timers, signal strength meter, band selection, frequency readout, and user-definable eight-character "name" for each

memorized station. Has RDS circuitry on FM to decode the newly-phased-in system for identifying stations by call letters, format, etc. 512 memory positions, upgradable to 2048. Tunes in .1 kHz increments. Selectable wide/narrow bandwidth for AM mode reception. Tunes MW in 9 or 10 kHz steps. Keypad frequency entry. Receives USB and LSB. Synchonous detector helps pick difficult-to-receive stations out of the crowd. Selectable automatic/manual gain control. Covers LW (150-353 kHz), MW (528-1611 kHz), SW (1612-30000 kHz), and FM (87.5-108 MHz). Excellent audio output, with separate treble and bass controls. Stereo through headphones or external speakers. Line-level out (left and right), external antenna, and 12 VDC-in jacks. Local/DX switch. Built extremely rugged. Multi-national power supply included.

An outstanding performer, and worth the price to a serious SWL or DX'er who requires portability.

Purchased from Universal Radio for $479 in April, 1993.

The Following is a comparison of the SONY ICF-SW77 and the GRUNDIG SATELLIT 700:

Both of the receivers you are looking at are pretty solid. The Sony is slightly smaller and has a somewhat more "finished" feel about it. The Grundig is SOLID with a much better sound. Neither is as good a SW signal receiver as the previous Sony, the '2010 (2001). However, they both have very advanced features; multiple (and in the Grundigs case, expandable) memories with alphanumeric tags so that you have a name as well as a frequency, all sorts of memory grouping and scanning etc. The Grundig has good RDS ident. on it's FM band, but I have a feeling that this isn't used much, if at all, in the US. If you intend to buy second-hand, be very wary of the SW77 - the early version was pretty flakey. The later version is better but still not as good as the '2010.
I think that the choice comes down to "feel". They are both quite complex to use, but both work as advertised. Try 'em both as they have quite distinct operational methods. If sheer performance on SW is the main point for you, compare them with the Sony ICF2010. You'll buy it and save some loot !
For what it's worth, I tried them both and settled on the Grundig. I have my Satellit 700 in daily use and it's performed without a hitch.

My reasons for the choice were:

1. Performance. The Grudig was much better than the early SW77.
2. Sound. I happen to prefer the slightly bassy Grundig sound to the somewhat sharper Sony.
3. Power. The Grundig takes D cells and can self-charge Nicads in the set, which is how I have it set up. (The SW77 used C cells)

They both run down batteries fast. The Sony worse than the Grundig due to it's smaller cells.
4. RDS. I love it and the SW77 doesn't have it.
5. Feel. I like the, I don't know, Germanic solidity and sheer heft of the Satellit. A Satellit with a full load of 4AH Nicads can tip the scales at twice the weight of a SW77. Of course, if drop one on your foot the Sony would be the better bet ! I only use the Grudig about the house. I have a '2010 for the road.

I hope this splurge hasn't clouded the issue for you.

Editor's Note:
I have one of these radios and love it! I sent the following message to someone just after I bought it.

I just recently forked out $500 and bought a Grundig Satalit 700. The sound from the radio is truely impressive! I have always wondered why broadcasters put music on shortwave, because it alway sounded like garbage. However with the 700 I can listen and enjoy the music. The 700 has Bass and Treble controls, which improve the sound quality but the Automatic Gain Control most likely does the most toward improving the sound (I'm not an expert, so this is just a guess!). Anyway my Wife regularly listens to music coming from a 60m band radio station in Guatemala, and can enjoy the sound. However there are some bad points. It is programable, but I have not worked out how to do it yet. Well I tried once and gave up. This is not too bad though, because BBC, Deutche Welle, and about 10 others are stored in a ROM table. And these frequences actual work (i.e. they are the frequencies for North America and NOT Germany).
Also I connected a long wire antenna and found my local AM station on shortwave. I guess the front-end is not good enough to sort the signals out when coming from a large antenna. But don't worry about this either.
If you only want to listen to the biggies like BBC, Deutche Welle, you won't need an external antenna. I am planning to put a Pre-selector between The Radio and the Antenna, and I think this will cure the problem of AM stations on shortwave and cut out some interference. Finally I recommend this radio to you. I'm sure you will have hours if enjoyment from it.

****
Grundig Satellit 500 - 2

Formerly Grundig's flagship portable SW receiver, this is still an excellent piece of equipment. Excellent sensitivity and selectivity. Digital display with two separate clocks (only one displayed at a time), signal strength meter, frequency readout, and four-character user-definable "name" for each memorized station. 42 memory positions. Tunes to .1 kHz

increments. Selectable wide/narrow bandwidth for AM mode reception. Tunes MW in 9 or 10 kHz steps. Keypad frequency entry. In addition to AM, has three receiving "modes" for LW, MW, and SW: USB, LSB, and "Sync," which should more accurately be described as "fine tuning," as this implementation of synchronous detection operates differently from the Satellit 700 or Sony 2010. Selectable automatic/manual gain control. Covers LW (150-353 kHz), MW (528-1611 kHz), SW (1612-30000 kHz), and FM (87.5-108 MHz).
Excellent audio output, with separate treble and bass controls. Stereo through headphones. Line-level out (mono), external antenna, and 12 VDC-in jacks. Local/DX switch.
Built extremely rugged. Power supply included.

An all-around great performer. Now that it's discontinued, many outlets are selling this unit at close-out prices, making this radio an excellent value for the money.

Purchased from Universal Radio for $379 in December, 1992.

I have a Grundig Satellit 500 and am basically satisfied with it. I miss the 512 memories of 700 and 'SSB clarify' control sometimes.

Yes, its 'sync' is exactly fine tuning in 100 Hz steps. However, it is rather simple to make it work similarly to '700 and '2010, because the detector chip is the same in all three. Only a switch with two pairs of contacts is needed. Another design fault, the excessive distortion in SSB mode, can be partly cured by adding two resistors. For serious DX-ers it may be important that the internal ferrite rod cannot be disabled on MW and LW in both 500 and 700, so the in-house noise may become a problem on these bands.

****
Lowe HF-150 - 1

The Lowe HF-150 (sold by Universal and EEB) is a nice compromise. Similar number of cubic inches as the Sony (different shape), but offering some features of the R8. Also the Lowe is made with a mostly solid alumnum case, which is better than the Sony or the Drake. The Lowe has dual antenna inputs (wire or SO-239), record out, audio out, 12vDC in. It can run off any 12V DC battery.
I use 7 aH gelcells which I recharge. The Lowe also takes 8 internal AA nicads *OR* disposable batteries. It will recharge the nicads with a builtin recharger if you plug it into an external power supply. It's a nice semi-portable radio. It has a few ideosyncracies, but you might want to look at it.

****
Lowe HF-225 - 2

I've had an HF-225 for a few years now, and I'm pretty happy with it. I use it mainly for broadcast listening. It's connected to 25m of random wire via a 5m coax run inside the house.

I tried using an ATU to improve the matching between the aerial and the coax, and on some frequencies it gave a (small) improvement in signal strength, but it was such a pain to keep retuning that I gave up using it.

I recently bought a "magnetic longwire balun", and this seems to offer the best of both worlds - improved matching between the wire and the coax, but no retuning necessary. It's rather expensive, though, and it may be that I'd have been just as well off with a home brew transformer on a ferrite ring...

The other potential advantage of an ATU, filtering out of strong signals well away from where you're listening, seems to be completely irrelevant on the HF-225. I've never yet found a case where switching in the attenuator did anything beneficial. The receiver's front end seems to be excellent in this respect.

I've got the sychronous detector option, and I wouldn't be without it. It quite often makes a heavily fading signal quite pleasant to listen to. Pity it doesn't have a selectable sideband option, though - I quite often find myself tuning an AM signal in the LSB or USB modes to try to get rid of an adjacent interfering signal.

Would I buy it again? Yes, unless I decided that I really wanted a receiver which offered a computer interface.

****
Sony SW-1 - 2

I bought an SW1E over a year ago, for listening to broadcast SW and FM at home and while travelling. I like this very small radio a lot. It is maybe expensive for a portable, but the build quality is very good, - everything looks and feels right.
Battery life is good, and the set DOES work with NiCads (2*AA) contrary to the instructions. Reception of broadcast SW is good, either with the whip or clothes-line antenna. I've never noticed any big problems from adjacent channels either. As a bonus, FM stereo reception is good through headphones. Audio quality from the in-built speaker is fair, but you'll want to use phones for noisy environments. The only bug with this radio is the memory capacity - only 10 mems is really not enough to cover ALL of AM and FM.
Summary - if you want a very small portable, and appreciate high quality (and can afford it), I would recommend the SW1E. Note the E, which denotes the SW1 kit without the active antenna and brief case - these add a lot to the price, and I don't rate the antenna too highly either.

****
Sony SW-15 - 1

I bought one of these puppies on impulse the other day (at my age you should give in to the occasional impulse, just so they keep coming). Cost $85; you could probably do better by shopping the discounters.

Specs:

Dual Conversion Receiver, 6 1/2 x 4 x 1 1/2 inches, 3 AA or 4.5v DC.

Nine Bands:

FM: 76-108 Mhz, 10.7 Mhz IF.

SW: 5.775 -6.425; 6.875-7.525; 9.375-10.025; 11.6.5-12.265; 15.00-15.65 17.50-18.15; 21.325-21.975. 1st IF 10.7 Mhz; 2nd IF 455 Khz.

MW: 530 - 1710 Khz; 455 Khz IF.

Analog Tuning dial, volume control, music/news tone switch, 7 position SW band selector. FM/MW/SW select buttons double as "on" switches. "Off" button. "Hold" button to disable "on" (prevents accidental turnons) Slide rule, multicolumn frequency display. Hand strap, foldout stand to hold at angle on table, soft carrying case. Basic shortwave guide. Telescoping antenna. FM/MW/SW "on" and tuning LEDs. Mono earphone jack.

Subjective Review:

I'm pretty impressed. Sensitivity is up there with the Pomtrex [:-)] without the "splatter" of strong stations. Analog tuning dial requires a delicate touch but for me that's part of the fun. Drift seems nonexistent; you get a station and it keeps it without a lot of vernier twiddling. MW performance was surprisingly good, as was FM. I'd recommend it as a starter radio.

****
Sony ICF-5100 - 1

I bought this radio in Kuala Lumpur in 1988, and I'm not sure if it goes by the same model number in other parts of the world. It is a shirt pocket analog tuned radio with coverage from 6MZ to about 21MZ in seven bands. The radio is very rugged and has served me well despite of the physical abuse it has gone through. Because of its small size the speaker is only small and the sound from it it a little tinny, but I used it mainly to receive news in countries without English language news services and in remote areas while camping etc. I recommend this radio to anyone, who considers size the most important factor. Cost was about US$70.

****
Sony ICF-7601 - 2

In some respects this is my favorite radio. No bells no whistles no FM stereo -- just a good solid (feels like a small brick)

analogue unit. It covers AM, FM and has 10 SW bands that cover most of the "out of band" frequencies. Band switching on SW is done by a slide on the front of the radio while buttons are used to switch from AM to FM to SW. The dial is accurate to 5 kHz so is very easy to locate a station. I believe that it was simply the best low cost analogue rig out there. It's still around and can be had for well under $100.00. Grab it!!

I have a 7601 also. Most of its weight is from the batteries and the speaker, giving it better tone and volume than smaller, lighter sets.

As with other cheap analog sets, it wasn't very hot out of the box.

If you "super tweek" the 7601, it's pretty good on AM, but no match for a 2010 or Superradio III. Most of the shortwave bands peaked up well, but I never could get 19 meters working right. As with most analog portables, the whip is part of the RF tuned circuit, so one must be careful to duplicate the exact listening conditions when tweeking the radio. Even the presence of headphones will shift the antenna tuning.

Unfortunately the 7601 picks up FM stations at various places on the shortwave bands. If you're far enough away from FM and TV stations you might have room for an R-390.

When going on trips I usually take my SW-1 because of the convenience of the presets and the reception flexibility provided by the active antenna that comes with it.

****
Sony ICF-SW33 - 1

I've owned this radio (SW33) for about 9 months and use it as my "carrying around the house rig." It was purchased to replace a Sony 7601 that now resides on my desk at college (things electronic can grow legs on a college campus). By far the best features of this unit are its convenient size and excellent performance on all bands, AM, SW and FM stereo. Don't get me wrong -- this is not a DX machine on SW but for listening to the major broadcasters, it's excellent.

The single filter selection seems just about right and tuning on SW is in 1 kHz intervals. This at least gives you a "fighting chance" to move away from interference. That's a major improvement over the 5 kHz that many radios in this price range allow. In addition, the dual conversion design on SW keeps image interference at bay - a major plus for a small portable.

The radio does not have a keypad so entering frequencies is a bit clumsy. However, by entering the middle frequency of each of the major SW bands in the 7 memories (5 memories plus 2 timer

memories) and slewing up or down from those positions you can get around reasonability fast. The SW bands are changed by a combination of 2 keystrokes.

The sleep control (shuts the radio off after 1 hour) can let you be lulled to sleep and the timer alarm can make sure that you get to work on time (radio shuts down after 2 hours if it is turned on by the timer). Setting the radio alarm is very easy - once you have set the clock, but that frankly, is a pain. The clock function, which works very well (combination world/home time), takes at least 7 distinct steps to set it. Fortunately the clock is fairly accurate (looses about 0.2 sec/day) so you don't have to reset it very often. The lighted dial (stays on for 20 sec at the touch of a button) is a nice touch.

Battery life is excellent contrary to the 1994 Passport to World Band Radio (see below). The radio has a battery "gauge" that is activated at the touch of a button radio and shows in the display as a battery icon with 3, 2, 1 or 0 dots inside of the battery outline. It disappears after about 5 seconds. As soon as the number of dots reaches 0, the radio shuts off immediately. I ran a a series of tests with Radio Shacks Super Alkaline batteries and got the following results: 3 dots showed for 37 hours, then 2 dots showed for an additional 11 hours, and finally 1 dot showed for 3.0 hours for a total of 51 hours. (Radio ran 1.5 to 2.5 hours/day with the volume control set at 1/2 volume most of the time). At $2.89 (plus 5% for tax) for a package of four AA batteries (the radio takes 3), that figures out to 4.5 cents/hour which is excellent. This figure differs greatly from that given in the 1994 Passport (25-30 cents/hour). I have no explaination for the difference but I stand by my test values.

Would I recommend this radio to anyone? If you do a lot of band-scanning, forget it; it will drive you crazy. But at about $140.00 plus shipping (NYC mail-order) it's an excellent "second" radio to carry around for listening to the major broadcasters. I like it!

****
Realistic DX-440 - 2

I have a DX-440 and I think it is a good 'dabble' radio but if I ever get serious I will look for a > $500 table model.

I love this radio! It's my main radio and I use it exclusively at home, moving it from room to room. It really is too large for travel

I've found the sensitivity to be tremendous on SW, MW and FM! Very rarely do I need to attach a clothsline antenna! It has continuous SW coverage, a great sounding speaker, BASS and Treble controls, two bandwidths, great sensitivity, good spurious signal rejection...It has all the features I wanted in a starter radio! I bought it about three years ago on sale for $150.00! I still

don't know why Radio Shack discontinued it. If you're
looking for a good starter shortwave radio and can still
find one laying about at a Radio Shack store priced to move,
GRAB IT!

****
DAK DMR-3000 - 1

I bought this radio since they have a 30-day money back guarantee
and I did not know if I would like the hobby or the radio. Good
points: direct-entry tuning, 36 station memories, fairly small so
it is easy to travel with, speaker sound was good, reception was
okay, but improved dramatically with the addition of the Radio
Shack 23' rollup longwire ($8.95). Bad points: only 5kHz tuning
steps, only major broadcast bands tunable (large gaps between
bands), selectivity not so good, no fine tuning, no BFO, no SSB
or CW, poor FM reception. All in all, not a bad radio of $69.90,
however, it left me wanting for more, so I got rid of it.

I have seen a couple of posts asking for a low cost SW receivers.
I have recently bought a DAK Model DMR-3000, for just
$69.90+$6.00 shipping from DAK - a mail order company.
The receiver has a direct access, so you can type in the desired
frequency, and a manual / automatic scanning system. It also has
a dual time clock with alarm and 'sleep' timer. Unfortunately you
can tune only to the commercial frequencies on SW, AM and FM
bands. I have to say though that cheapness comes at a price. The
first receiver I got was defective so I had to ship it back and
ask for a replacement. Now, I received a new one which works very
well.

Compared to my Sony ICF-7601 the DAK unit is an insensitive
brick. The fancy clock and timer features aren't really worth it.
About the only thing nice is the FM Stereo support if you plug in
headphones but the FM sensitivity leaves much to be desired as
well.
Something else to watch for.... That pretty lettering on the
buttons will wear off REAL fast. If you haven't used it much yet
you won't see a wear off REAL fast. If you haven't used it much
yet you won't see a problem. After you've done some tuning you'll
see the pretty arrows disappear from the buttons.

****
Sangean ATS-803A - 1

Since I was now turned on by SWL'ing, I moved up to what most
people agree is the best all-around radio for this price. Good
points: excellent frequency band coverage (150kHz to 30mHz), fine
tuning, good selectivity, BFO for SSB and CW, many scanning
options, lots of accessories included, good AM and FM reception.
Bad points: way too big to travel with, high battery consumption,
synthesizer noise in background all the time, scanning frequently

skipped lots of "listenable" stations that I was able to get by manual tuning (what's the use in scanning, then?). I found that adding a longwire antenna only increased interference and noise while not improving the set's scanning sensitivity. Overall, a fairly good radio for the price...

I have a Sangean ATS803A which I love. Comments to quote me on would be that it's an excellent beginner's radio for the price. Although I've heard that the 818 is the "latest and greatest" in this price/performance category. I especially love the full coverage 150kc-30mhz and the (albeit lo tech bfo) SSB capability.

****
Sony ICF-SW20 - 1

I was in dispair when I could not find a decent travel portable for under $200. However, I accidentally crossed paths with a Sony ICF-SW20 on sale (normally $99, on sale for $49.99) at a local store and had to check it out. It is an analogue set, but since I got a 30-day return policy on it, what the heck? Good points: analogue tuning so no problem with confining 5kHz tuning steps, INCREDIBLE SENSITIVITY - this radio blew the DAK and Sangean away with the number of stations I picked up, good selectivity (no fine tuning knob - all you need to do is turn the tuning knob slowly), tiny size (4"w x 3"t x 1"d), small whip antenna (only 18"), addition of Radio Shack rollup longwire increased sensitivity even more, great low price (if I lose it or its gets destroyed, no problem replacing it), tuning bands are wider than the major broadcast bands, so you do get some utilitiy reception as well as WWV, AM and FM are really sensitive while FM goes from 76mHz to 108mHz so I can pick up some TV as well. Bad points: frequencies cover only seven broadcast bands (I can live with that, though), only monaural earphone included (however, you can get a $1.39 mono to stereo headphone plug), no BFO for SSB or CW, no station memories. All in all, this radio gave me the best price/features/size ratio of the ones I checked out first-hand. It's a keeper for me!

****
Magnavox 3625 - 1

Finally received my Magnavox 3625! Well, I'm certainly happy I purchased this little radio. Sure, it's not top shelf, but it's suitable for travel purposes and gives adequate SW coverage.

Has these features:
Travel Lock
Alarm (beeps, does not turn on radio)
Sleep Timer
9/10 KHz switch - for world travel
12 hour clock (however, when unit is swith to 9 KHz steps 24 hour

clock kicks in)
20 presets - 5 for each band FM, AM, SW1, SW2
Dual time
Auto store - this feature allows the radio to automatically find
the five strongest stations in an area and program
them into the memory of the FM & AM band.
Back stand
Antenna swivels and rotates
Runs on four AA batteries.

Well, the sensitivity is quite good. Steps in 1 KHz increments.
No tuning knob but the slew tuning buttons work just fine. It's
about the size of a paperback book and can be taken anywhere
reasonably well. No carrying strap,
though. The SW coverage is limited but it grabs the major
broadcasters exceptionally well. Example: the 41 meter band is
covered from 7100 to 7300. So if you want to listen to the BBC
on 7325, you're oput of luck.

However, I like to listen to the BBC on 12095 or 15070 European
signals during the day that I cangrab when I attach a long wire.
The 3625 can't tune these freqs. but it can grab 15400 (from
africa) WITHOUT a long wire antenna! I'm pretty impressed.

Bottom line....A GREAT little travel radio for $70.00! Call a
Magnavox outlet if you are interested.

****
Magnavox AE-3805 - 2

Great little digital portable. Good sensitivity, average
selectivity. Covers MW (in 10 kHz steps only), FM (no stereo),
and SW in two "bands": 3200-7300 kHz and 9500-21750 kHz. Built-
in timer/clock (12 hour format only), 5 programmable memory
locations per band. Great for travel use.

Purchased from Damark for $49 in May, 1993.

$50 from Damark closeout -- cheapie category

****
Emerson PSW-4010 - 1

Great analog portable. Good sensitivity and selectivity. Covers
MW, FM (stereo through headphones), and SW in 8 bands (roughly
split out as 13m, 16m, 19m, 25m, 31m, 41m, 49m, and
60/75/90/120m). An excellent travel portable.
This is the same radio as the Sangean SG-789.

Purchased from DAK for $49 in June, 1988.

****
Sony ICF-5900W - 1

Sony ICF-5900W was a good radio in its day, but isn't worth
listing now.

****
Icom IC-R70 - 1

I purchased my R70 in early 1983. It came with a scratched plastic
window for the digital display, which the factory replaced. It is
an extremely sensitive receiver. I installed the FM detector board
option, which is highly useful for Sub-Carrier detection from FM
broadcast receivers in conjuction with the R70's ability to tune
below 100khz without a frequency convertor. The so-called PassBand
Tuning (PBT), in actuality an asymmetrical bandwidth narrowing
control, is very mediocre with the factory 455khz filters. Replacing
the 455Khz ceramic SSB filter with a Fox-Tango FT-44 2.4khz 8-pole
crystal filter (equivolent to the ICOM FL-44) makes the passband
filter work as one would want. The AM 455Khz ceramic filter is junk,
and was replaced with a higher quality "4Khz" ceramic filter from
the long-defunct Radio Plus firm. The actual specs for the 4Khz filter
indicate that it is a slightly asymmetrical filter of 5.6Khz bandwidth,
causing a slight degredation of the "highs" (The original spec is
for a 6Khz bandwidth; the 9Mhz AM filter is a 6-pole device). Inclusion
of both replacement 455Khz filters results in a combined shape factor
of much better than 2:1 on AM or SSB. In addition, the RF amplifier
was enabled for AM broadcast band use, and an MOV was placed across
the AC input for protection against voltage transients. [Actually,
a Transorb would be far better in defending against narrow transients.]
For awhile, I replaced the diode AM detector with a Shottkey diode,
but my ears could detect no difference in distortion, and so the
original AM diode was returned to the circuitry. It's been serviced
once by ICOM for an intermittant problem ($150 ouch). There exists
several modifications to enable selection of the 455Khz SSB filter
whilst in AM mode for additional selectivity.

Drake SPR-4 - 1

****
Icom R-71A - 2

Eskab & Edvis of Sweden used to offer a Phase-Locked AM (PLAM) detector for
the R-70 and later R-71; they also offer a version for the NRD525. I have
the R71 version. It is a synchronous detector which allows selection of USB
or LSB via the IF filter/BFO offset. The PLAM board phase-locks one of the
R71 local oscillators (I forget which one, probably the BFO) to the AM
carrier. It contains its own product detector. The lock range is not very
large, perhaps +/- 20 Hz. The detector seems to have lower distortion than

the ICOM AM detector.

Compared to ECSSB, aside from the advantages of phase-locking the product detector BFO, the PLAM unit also lowers the corner-frequency of ICOM's low-pass audio filter, giving better bass response than normal SSB mode on the R71. I find that this improves the intelligibility of the signal.

The PLAM board piggybacks in the mounting area for the ICOM FM option board; both can coexist. Installation is somewhat difficult, as it involves connecting over a dozen wires to various boards in the R71.

Eskab & Edvis also offered a 4 KHz 2nd IF crystal filter for the R71. This installs fairly easily in place of the narrow CW filter. It is very much better than the stock ICOM 6 kHz bandwidth, which is wide-open until it hits at cheap ceramic filter in the 3rd (455 kHz) IF.

I don't know if Eskab & Edvis still offer the R-71 PLAM and 4 kHz filter. They used to advertise in the WRTH.

Regarding other options: I believe Sherwood Engineering offers an outboard synchronous detector for the R71 as well as other receivers. The Kiwa MAP unit should also be adaptable to the R71.

Also, Dom Moman of Shortwave Horizons publishes a modification manual, which details mods like enabling the preamp on MW, true pass-band tuning, sub-10 Hz RIT, etc.

Kenwood R-2000 - 1

****
Kenwood R-5000 - 1

****
Kenwood TS-450-1

I know it's not a reciever, but since it has general coverage,I decided to put it in here.The TS-450S iaN amateur transciever that costs little more than a R-5000,and if you have your ham ticket or are thinking about getting it,may be worth checking out if you are in the market for a new toy.I'd be willing to bet the replacement for the 5000 will look just like the 450,just like the 5000 looks like the 450's predacessor,the TS440S.First thing it is EXACTLY the same size as the 5000/440.Unlike the 5000/440,it has an LCD display that is unlike any other I've ever seen.It is almost too bright!The brightness cannot be adjusted,unfortunatly.The 450 recieves in all the standard modes except for fax.It has a"normal"keypad unlike the 5000 and the aggravating CW that is producewhen a major button is pressed can be silenced by y -a simple menuss,you dont have to cut a wire like the 5000he S-Meter is a bar-graph type that I like but some people dont.It also has an Audio meter function that kin baffles me.I still dont know what use it is,but it looks nice!Probably the most notable thing you will observe when using the 450 is the QUIET!It is so quiet,it seems strange the first couple of times you use it.The AGC is non-defeatable and has a fast/slow toggle.It is the strangest

and slowest AGC I've ever seen,on slow the S-Meter just sits there and then SLOWLY goes down.On fast,it just isn't quite so slow.It seems to work ok,but is really odd.The stock filter for AM is a mile wide but you can add the YK88 AM filter but you wll lose the open slot for the 8.83 ssb filter.I'm not sure,but the 450 seems to have the same stock am filter the 5000 has.On SSB,it uses one of the better Murata ceramic filters and is ok but the optional SSB filters are highly recommended.The audio is FANTASTIC on all modes and if you put one of the minimus speakers from Radio Shack on it,you will like it a lot.Dont bother with the Kenwood speakers,the one that goes with the 450 is not too good and is expensive too!The ergonomics are pretty good,except for the tuning knob,yes like all the recent vintage Kenwood rigs,IT DOESN'T HAVE A FINGER HOLE!!Why does Kenwood insist on putting these awful knobs on all the rigs they have made lately!All in all,it is a very good riever in almost all respects,and since t it only costs about $100 more than a 5000,it is worth a lookND as a bonus, the recieve coverage goes up to 40 mhz!If you are into low band scanning,you will hear things on the 450 you never knew existed on your scanner.If you can swing the 450's sister model the TS690,you can recieve all the way to 60 mhz. When the 5000 is put out to pasture,if it's replacement is the 450 without the transmitter,it will be very tough competition for the other makes.All it needs is Sync.detection and you really couldn't ask for much more.

****
Japan Radio Company NRD-515

THE all time most user-friendly recieveof recent vintagHas PBT,analog fine tune,four I.F.bandwiths,AM,LSB,USB,and RTTY modes.There is no squelch but it really doesnt matter much.Of all the recievers I have owned,or ad over here to play with,it is the most sensitive in the SSB modeI have the standard 6 and 2.4 khz filters,and th600 and 300 hz filters whitch are great for RTTY or CW(if you are truly desparate!)The "protection"diodes have been removed due to intermod from a local AM station.The reciever's case,front and back panels are made of Aluminum,no plastic to crack on the 515!The audio in AM is very bad,almost as bad as the Icom R-71a,but in a different way.The audio is "fuzzy"out of the speaker jack,but not too bad out of the record jack but still a little "fuzzy".In the SSB modes,the audio is pretty clear and doesn't fatigue me like the Icom dos far as thergonomics goes,it's almost prefect!All the knobs are the right size,the tuning knob is large and has a nice deep finger hole(Kenwood,are you listening???).The S-meter is big and easily seen across the room.Dynamic range is very good after the diodes have been clipped(a one minute operation).The filters all are good quality and have good shape factors.This was the first "affordable"rig that had a memory option that was worth something with 24 or 96 channels available. The NDH-518 I have(96 ch.)is also made totally out of cast and sheet aluminum and matches the 515's styling.It stores frequency only,unfortunatly, due to the year it was designeIm guessing.There are lots of these recievers floating around on the used market for about $600 or so.Universal seems to have a lot of them passing thrgh the store.

****
Japan Radio Company NRD-525 - 1

This is a great reciever,marred only by bad audio and a hiss that will drive
you bonkers if you have good hearing and a speaker that can put out the highs.
I have had two of these,the first I traded for a sateite setup,and the one I
have now.The newer reciever has mucbetter audio then the first one and lesess
hiss too.Ergonomics are very good MUCH,MUCH better than the Drake
R-8.(IMHO,the Drake is seriously overrated and all the stuff about made in the
U.S.A.is kind of funny cause a LOT of the innards are MADE IN JAPAN!!!)Oh
well,back to the 525,if you are into AM,it's probably not the reciever for you,
but in allthe other modes,it is one of the best consumer grade recievers ever
made.Performance in all modes is basically excellent except fothe audio pr
problem,and stability is rock solid.JRC has only cut a few corners compared
to the 515,probably the ultimate in construction for consumer recievers.
The case is made of very thin sheet metal and the front panel is plastic.The
keys fit loose in the keypad but work ok.The display has four brightness
levels and is very easily read from across the room.The S-Meter is "digital"
and is a floating vertical bar segment that seems to be yellow on some samples,
and green on some others.It is sort of "spastic"and twitched a lot on the
first one I had,but not as much on the seconone.The first 525 I had would
"click" on strong AM signals,but the new one doesn't.The main tuning knob
spins very smoothly and has a nice finger hole.(KENWOOD,WHY DONT YOU LISTEN!!)
All in all, a great reciever.

****
Japan Radio Company NRD-535D - 2

I have been using a NRD-535 for two years and i am very pleased
with it. Although the relative high price makes this a radio
for the serious DXer and maybe not the average Shortwave listener.

The NRD-535 has very good ergonomics. It is very easy to operate
during long listening passes. It has 200 memory channels which comes
in handy for storing interesting frequencies that you want to
check later, or stations that you want to check regulary.

+ side:
On the plus side there is the BWC and the very good sensitivity.
The BWC combined with the PBT makes it possible to make
a station readable that is very close to another station, or
a interfering RTTY transmitter. I find that i mostly uses
the SSB mode and zero tunes the station, and then uses the
BWC and PBT to get the most readable signal. The BWC and
PBT has saved a lot of reports for me. The sensitivity
is excelent. It is among the best in this price class.

- side:
The audio in the built in speaker is mediocre to put it mildly.
A station that you read loud and clear in the earphones can be
inaudible in the built in speaker. The selectivity is not as
good as it could be. The NRD is very sensitive for splatter from
nearby stations, and this can totally drown the station that you
want to listen to. The ECSS option that you can equip your NRD with
is a joke. I have it installed but i NEVER uses it. The only time
you can use the ECSS with any improvement of the signal, is if the

received signal is strong to begin with. Don't waste your money on the ECSS.

The conclusion is that the NRD-535 is a very good receiver for the serious DXer but it has some shortcomings. The 535 is much better than the Icom R-70 that i had before, and i would recommend it to anyone that asked me. What you might want to do is change the filters to somewhat sharper filters. That goes for both the 9 MHz and the 455 kHz filters.

****
Yaesu FRG-100 - 1

****
Panasonic RFB-65L - 2

$220 from Universal, EEB, etc. -- my main set, an excellent portable, many features, nice construction and details.

****
Sony SW-55 - 2

This is my principal radio at the present time (I also have the Sony ICF-SW33 and the Sony 7601). This rig is an extremely sophisticated piece of equipment. I especially like the fact that you can store up to 125 frequencies on 25 electronic pages that can be named as you wish (by country). Once programed this is very convenient. The two filter selections are well chosen (much better than the stock Sony 2010 filters). My use the radio to copy WEFAX with excellent results attests to its stability (and that it receives USB and LSB).

The versatile timer/alarm and tape remote feature allow automatic recording with certain tape recorders (Sony and others) of up to five times and frequencies in a 24 hour period. I use this feature all of the time. Audio (stereo on FM) qualitity for a portable is very good; better I believe than the stock 2010 although as with the 2010, it is improved with a set of external speakers.

Unlike the 2010, the SW55 does not have synchronous detection. That's too bad because I believe that if it had this feature it would blow away
tition. As it stands it is an excellent radio. Most interference can be eliminated with the narrow filter or moving away from the interference a bit (the radio is tunable in steps of 0.1 kHz) so the lack of sd is not critical. I really believe that Sony did not include it because it would have then had a very negative impact on sales of the SW77.

Would I buy this radio again. You bet! The only problem I've had in the year an
owned it is that the lettering has worn off the 1, 5, 0 and EXE

keys on the keypad. That should not happen on a $300.00 radio!

I just got a SW-55 for Christmas and find it to be an outstanding radio. Now that I've said that, you should know that I am new to all of this "DX-ing" (is that how you say it?). However, I can tell you that it's reception with the built-in antenna and with the included auxiliary antenna is very good. I found that the radio comes pre-programmed with a number of stations (BBC, Radio Moscow, etc.) and they come in great.

As for your questions, I've found the speaker in the SW-55 to be very high quality, delivering plenty of volume and good sound. There are several "tone" switches (news vs. music setting, etc.) that enhance the reception and its sound. And, the unit is packaged well for travel.

The radio itself has several nice features (I don't know how they compare to other radios since I didn't comparison shop). There are several output jacks that make it easy to connect to external speakers, tape recorders, headphones, etc. There are local/long distance antenna settings. There are lots of ways to set and look at the time (local, UTC, Daylight savings, etc.) There are alarms and sleep settings (for on the road).

The tuning portion is quite nice. The radio of course offers digital tuning (punching numbers in to get to a freq.). But I find that I often use the "analog" tuning dial as well to either fine tune a station or to see what else is out there.

Best of all, the unit is packaged well. As a new user, I have enjoyed the little things Sony has done to make this experience a good one for the new user. Everything from the documentation to the carrying case has made it quick and easy for me to start listening to short wave. Included is a book that is a publishing of all the various countries broadcasting, with their freqs and times. (I gather that these things change quite a bit, but I presume that Sony updates it often)

****
Philips AE3905 - 1

In short, in my experience, the AE3905 is no real great shakes. It looks neat as hell, and marks its owner as a man of taste and distinction with more money than brains (like I said, *I* have one). Its shortwave performance is mediocre. Using this in a hotel last February, I found that attaching the included reel antenna caused the radio to overload fairly badly. The batteries don't last very long. The filters included are fair, but you still get a fair amount of interference from adjacent stations (not as bad as some small portables, but not good). I certainly wouldn't want to use this as my primary radio. For portability, it's fantastic. I can listen to the BBC or VoA anywhere. The radio fits in my shirt pocket, although reception in my pocket isn't all that good. In short, the radio isn't worth what Philips charges for it, but if you've got more money than you know what to do with and a desire to have a flashy looking toy, it'll do.

The radio has only recently been available in small quantities in the U.S., and appears to have been discontinued in Europe. I got a reconditioned copy for $179 from the Magnavox factory outlet in Kentucky. Universal lists the radio in their catalog for something like $250 new if I recall correctly. You're not likely to find it anywhere else.

****
WATKINS-JOHNSON HF-1000 HF RECEIVER

I will be doing a lot of comparisons to my other receiver, an NRD-525. To give a basis for comparison, the NRD-525 has been upgraded by the following modifications:

ESKA PLAM board with four added filters following the IF strip
Installation of ESKA Aux filter in the NRD Aux position
Installation of the JRC 1.8 KHz filter in the Narrow position
Replacement of RF chokes on the filter board with shielded units
ESKA agc modification

These modifications have improved the shape factor on the NRD's filters from an average of 2.0:1 to 1.7:1 (60:6 dB). The ultimate rejection has improved from about -60 dB to -75 dB. These modifications are noticeable in on the air listening tests. The NRD hiss has been removed.

About two months ago, I bought another receiver, a Watkins-Johnson HF-1000. I didn't really think this receiver would be much better than the NRD, and I intended to return it if this was the case. I was wrong. The Watkins-Johnson receiver is clearly superior to the NRD in on the air listening tests, almost in every case. In rare cases it is a tie. The comparisons are done using an A/B switch that switches both the RF and audio lines so that comparisons can be made quickly on the same signal. Comparisons were all done in ECSS mode with the receiver settings made as close as possible to each other.

I also did some bench testing of both receivers, and the numbers that the tests give are not all that much different for both receivers, with the exception of filter shape factor. The HF-1000 shape factors run about 1.1:1 (60:6 dB). This does not explain the main difference between the comparisons, however. The HF-1000 seems to be superior in pulling out weak signals. I have heard many signals that are muddled and hard to understand on the NRD-525 sound sharp and clear on the HF-1000. Several other points:

AGC: The digitally processed AGC on the HF-1000 is far superior to the analog AGC on the NRD, even with the ESKA kit installed.
Notch filter: Again, the digital IF notch filter is superior.
Audio: The NRD audio has always sounded low frequency and mushy; audio on the HF-1000 is crisp and clear. This is an important item.
Operating: I like the controls on the HF-1000. They are flexible, yet easy to use. The set is a pleasure to operate.
Synthesizer spikes: The NRD has a synthesizer spike every 100 KHz. While these are not all that strong, some of them fall on inconvenient

frequencies, like the propagation beacons on 14100 KHz. There are
a few spikes on the HF-1000 at even 2 MHz points.

The only shortcomings in the HF-1000 I've noticed are the lack of synchronous
detection (this is supposed to be sent out as an upgrade chip later), and
IF passband tuning would be useful in the SSB modes. It is present in CW.

As you have probably guessed, I'm real happy with this receiver. I think
it will be the last one I will have to buy for quite a while.

Watkins-Johnson HF-1000 Review Part 2

Watkins-Johnson SAM option for HF-1000

Recently I received the firmware for installing Synchronous AM
(SAM) detection in my HF-1000 receiver. I was able to install it in
about 1/2 hour and it worked great. In testing it I compared it to the
ESKA phase lock AM board installed in my NRD-525. Here are the results
for strong and weak signals:

Parameter	ESKA+NRD	HF-1000+SAM
Weak signal lock range	+- 20 Hz	+-250 Hz
Strong sig lock range	+- 40 Hz	+-900 Hz

As an on-the-air test I tried to lock onto Radio Pyongyang, 13760 KHz at
1300 UTC. The signal was weak and fading rapidly at 1300 UTC and was being
broadcast on 13760.1 KHz. The HF-1000 was able to lock it immediately even
when set to 13760.000. NRD was not able to lock it at all, even when set to
13760.1. Impressive!

Another modification in the new firmware is a change in the AGC function.
It is now possible to set three decay rates from the front panel for each
AGC setting, Fast, Medium and Slow. In addition it is possible to allow
the manual gain setting to control the AGC threshold while in AGC mode.
This is a great help for the AGC control. I spent many hours trying to
get the AGC decay rates correct on my NRD receiver, and was never happy
with that AGC. This required pulling out the IF board, replacing some of
the SMDs, putting it all back together, and then trying it. Digital AGC
processing on the HF-1000 makes this a snap, taking only a few seconds.

After several months of using this new mode of reception, it is the one
I nearly always use for SWLing and DXing. For weak AM signals it is hard
to beat. If the signal is readable at all, it will be able to lock on it.
By using both sidebands, you end up with a better signal to noise ratio
than with only one sideband. The HF-1000 is even more impressive now
with this addition. The only times that I have had to resort to ECSS on
AM signals is when there is interference on one sideband. Watkins-Johnson
reports that they will have single sideband SAM in the future which will
get around this. There are several other options that they are working on,
one of which is a plug in board for PC processing. I assume this will have
real time spectrum analysis and memory functions built in.

****
AR3000 - 1 (More Info is Available by e-mail from (jlloyd@cs.clemson.edu)

My general impression, is that this is anyhow a very good apparate. It offers continuous coverage 0.1 : 2036 Mhz, all mode, RS232 interfacing, quite good operating commands, triple conversion, 400 memories; it is very compact (small tabletop, 1.2 Kg.), semi-portable; its 13 auto-selected front-end band filters reduce to some extent unavoidable intermodulation. In general, this set offers a self contained and very well balanced compromise of a lot of different demanding features, but will show its best when fully interfaced.

Its price, here in Italy, has been varying greatly during the years. Therefore I cannot say how it really competes with the choice of HF receiver + scanner setup. It is still unclear to me how far is the AR3000 from dedicated traffic receivers.

I'm finding a number of defects and "whish it was" that I'm going to list (I would like to hear comments about), but perhaps I'm just pretending too much from a receiver in which something had to be traded off between versatility and performance. Please note that I have a 4 years old AR3000; some defects could have been amelio-rated in the 3000A, or may eventually be specific of my unit.

Hardware limits:

-AM selectivity is mediocre (approx 10 khz bandwidth). I feel the lack of a variable Am bandwidth. SWL in crowded bands is too often spoiled by the 5Khz whistle. Thinking it was a problem of i.f. detuning, I once sent it to the service to have it retuned, but with no perceivable gain.

-In AM I do experience blocking. A strong transmitter mutes any weaker adjacent signal lying some -+30 khz apart. I suspect this may be rather a problem of AGC voltage (see below on squelch), because the feedback signal is obtained from the previous to the last i.f. stage, which may have a larger than necessary (for AM) bandwidth.

-The squelch control (essential in search mode) is not very functional. On my set almost everything passes for knob positions below .3 and only >S6 passes when I increase to .5. It may be a problem of adjustment, but also reflect the inaccurate behaviour of the S-meter, which (I have no measurements to support) seems not properly logarithmic. I have the impression that weak signals give a high S readout when close to stronger ones, because the S-meter averages on a larger bandwidth than the demodulator.
Also, the squelch just mutes the a.f. output, but not the line out signal.

-The internal speaker fidelity is scarce. No tone controls exist. Clarity improves a lot when connected to an external speaker or lineout. No noise reduction circuitry is present. External audio equalization does a lot, but of course is not the cure for low selectivity.

-There is no i.f. direct output for say a spectrum analyzer or a different demodulator (say wide band AM for satellite or TV, stereo FM decoder, sinchro SB AM decoder). A modify could be to buffer it to a backpanel jack.

-Intermodulation IS present. I live very close to power MW transmitter, and in the times they're on the whole band .5 : 2.5 Mhz is unusable, with crosstalk on every possible combination of transmitter frequencies. At evening I sometimes hear sw bc stations crosstalks on 20 : 30 Mhz, even with a short random wire antenna. However, I don't hear crosstalk due to FM transmitters, which are also close to my place. The 13 front end filters seem to do their job, since strong signals don't cause crosstalk out of their respective preselector bands.

-I'm not very satisfied with the small and clicking rotary tuning control. In the AR3000a it has been replaced with a (I guess optically encoded) smooth one. I would rather appreciate a jog-shuttle like the one on VCRs, and the mod itself seems quite easy too.
The tuning is however digital, and stepping frequency causes clicks, which eventually trigger the squelch threshold during search. The final a.f. is briefly muted while stepping, but I prefer the line-out signal which is unaffected and thus has a faster response.

-There is a single antenna input for the entire range. I think this however is correct, because whichever choice on different antennas is entirely dependent on the user setup, and should be rather left to an externally programmed antenna switch.

-Some digital RFI is generated, expecially in the high HF and low VHF. A real antenna connected with a shielded cable and a good earth however wash it out.

-Some small change in sensivity and background noise can be perceived when passing across one of the 13 band boundaries (by the way, they are 0.1-0.5, 0.5-2.5, 2.5-10, 10-30, 30-50, 50-108, 108-136, 136-174, 174-224, 224-335, 335-500, 500-940, 940-2036 Mhz), but this is unavoidable, and also due to the change of the superetherodyne scheme.

Software limitations:

-Scanning is already very versatile for such a small machine. However, auto memory storage of catched frequencies was forgotten. Also, the oddities in the S-metering (see above) impose manual choice when scanning non regularly channellized bands.

-There is a priority channel lookup feature, but the attention threshold has to be the current squelch position. Apparently (see
//ftp.funet.fi/pub/dx/receivers/mods/aor300.mod) in
the 3000a a programmable lookup time was implemented, but it is not present on the 3000.

-The mode and the tuning step change are set with several keystrokes. I feel it quite tricky, expecially considering that I generally have to switch quickly between 50 Hz/SSB, 500Hz/Am, 1.25 Khz/nfm, 50 Khz/WFM. The step x10 command is

very useful, but not enough.

Since the S-meter signal is output on the RS232, and the unit may be fully remotely commanded, all this limits can be cleverly threspassed by an external control software, thought.

I have experienced problems with the 232 interface. The cpu goes crazy very easily when the connector is plugged in/out, unless the "remote" switch on pin 7 is previously operated. This is (I understand) the reason why it was added on the 3000a. When the cpu goes on the moon, one generally has to open the set and to push the reset button (backside of the keyboard), losing all the memories .
Also, I cannot interface the scanner with an Atari St, either because the TTL level Txdata is to low for that serial port or because the continuous output of the S-meter simply is too fast for the Atari bios.
Passing by, note that the RS232 speed can be set to 9600 baud with a switch on the cpu board.

> Have the modification procedures changed at all for the Pro43?

Yes. the modification procedure for the new 43 (with an A in the serial number) is as follows:

1. Sell new 43 (with an A in the serial number).
2. Buy old 43 (without an A in the serial number).
3. Follow mod for old 43 (as can be found in /pub/hamradio/mods/tandy at oak.oakland.edu, aka SimTel)
4. You now have extended RX on your new 43.

>Is it true ??
>if yes, does a mod exist to adapt the scanner?

>thanx for support saidji@eig.unige.ch

The most important issue is what bands the scanner covers.
Scanners that do not have continous coverage usually have 30-54 Mhz
coverage in the US version and 66-88 Mhz in the European version.
Although some of the scanners can be modified for European coverage
or vice versa by just clipping a diode, the RF front end usually
is not optimized for the different band. The 66-80 Mhz range
is heavily used in Europe. In Denmark you find police and fire
in this range.

Channel spacing usually is not a problem. If the scanner steps
30 khz in the cellular bands it might be a problem as most
European countries use 25 or 12.5 khz spacing. If you can
select another step size on the scanner you will have no problems.

You have the revised version of the PRO-43, identified by an "A" suffix on
the FCC ID nbr (i.e. AAO20-300A). There is no cellular mod for that version.
You can add a diode at D3 to access 68-88 MHz.

The "ATT" switch adds 10db of attenuation to the incoming signal. It's
useful when one or more high-power signals interfere with adjacent frequencies,
reducing the receiver's sensitivity ("de-sense"). See the note in the manual
under Cross Modulation.
As it attenuates all signals, leave it in the 0db position unless you
have a problem.

I'm sorry to have to start this thread over again, my local site
seems to have expired this stuff REALLY fast.

I haven't been following close enough to notice if anyone's
found any answers but here's one for ya all.

This company called "Mr. Bracket" from Farmington Hills, MI
supplies my newest toy. It's called "POWER-n-PLAY". It has
selectable outputs of 4.5/6/9V from the cigarette lighter and it
has a stereo jack that you put into a stereo->mono adapter then
into your little scanner and "VIOLA!" scanner through the car
speakers in stereo! (Of course you tune both to the same freq)

The item I've got here is part #9002, barcode SKU of 0-82484-09002-9.
It comes with adapters and all too. Worked REALLY good. They
also have a "Silent Play" type of adapter too. No power, just
adapter. At Walmart in New Hampshire, the Power-N-Play that I
got was... $24.95

Have fun all!

P.S. On my drive to work this AM, the fuse was blown. News as
it develops.

>
>-Richard
>

Richard, you might want to check again. Those frequencies may be just
above the commercial FM broadcast frequencies, but they are, for the
purposes of commercial and private aviation, transmitted in the AM mode. The
location in the frequency spectrum does not determine the mode. To check
it out, just punch in an active frequency from you airport and put the
mode in as NFM or WFM and see what you hear.

3063. Detecting scanners

Newsgroup: rec.radio.scanner
Date: 1994-09-30 14:50:16 UTC
From: zenith89@bnr.ca
Message-ID: <zenith89-300994105017@47.80.2.73>
Source record: 267937

I have had a discussion via email re: detecting scanners and as
a result did a few tests last night. If anyone is interested...

I first tried detecting a PRO-41 (el cheapo 10 channel scanner)
via a PRO-2006. I selected one of the channels being scanned by
the 41, our local Police channel 2 at "X" MHz (I can't remember
the frequency & it doesn't matter) and subtracted 10.7 MHz, yielding
frequency "Y". I setup the 2006 to do a search in the area of "Y"
MHz. Sure enough, when I turned the PRO-41 on, the 2006 stopped
exactly on frequency "Y". It sounded like "chuff-chuff-chuff-chuff"
and this would stop when I turned the PRO-41 off or manually selected
another channel.

This was indoors, so I was limited as to how far I could move from
the 2006, but I was able to move 30 feet away and the 2006 still
stopped on "Y". This is with the 2006's whip antenna fully up, the
squelch setting on about 2 and the modulation mode set to "NFM".

The next test was in the cordless phone band, ie. 46 MHz. With the
PRO-41 scanning over 46.870 MHz and the 2006 tuned to 36.17 Mhz the
distinctive chuffing noise could be heard thru the 2006's speaker.
When I turned the PRO-41 off though, there was still a chuffing
noise although weaker and not as fast. Why? I assume this means there
is another scanner scanning through 46.870 MHz nearby.

Next:

- more testing on the range over which the PRO-41 is detectable
- we'll try to track down the SCANNER SCUM monitoring the cordless
phone frequencies nearby. We have a HAM living behind us, I'll
bet that's who it is.

BTW, I have a PRO-2006 and a PRO-43 as well and I have read in
here before that GRE scanners have unique IF's... does anyone know
what they are?

As far as I remember these units aren't call on regular car accidents or
simple stuff. I think the phrases:
"Do you need any PDS units over there"? or
"I will be sending a PDS units to this location..."
were used when something really happens. Police Dog Search(?) is quite
possible, I think. I'll try to catch some more cases!

Try adding a diode at position D4 -- you seemed to imply there was
a D4 location. They may have inverted the logic and made its absense
means no cell instead of presence. So far, no one has come forward
and said they have tried this -- so if you do, please report your
findings here (if it works or doesn't and what it does do, if you
can determine any change). You could use a 1N914 or 1N4148 signal
diode, Rat Shack used to carry them in packets of 20 for $2, they
probably still do.

PRO-43 ENHANCEMENT
MEMORY EXPANSION & "FADE-AWAY" LIGHT
Brett Bennett 4/12/94
bbb@kuhub.cc.ukans.edu
Copyright 1994 B&D Electronics All Rights Reserved

INTRODUCTION

The following document details two enhancement
modifications that are possible on the Radio Shack PRO-43 scanning
radio. The first modification doubles the factory standard memory
capacity, allowing you to enjoy an additional 200 channels of memory,
plus 10 more monitor memories. After completing the first
modification, it is a fairly simple matter to add a 7 to 10 second delay
feature to the LCD back-light lamp circuit. I designed and performed
these modifications on my PRO-43 and they do work. As I understand
it, there (has been/is being) presented in WORLD SCANNER
REPORT a similar memory expansion. I have not seen this
modification and for all I know it is a better way of doing it. What is
presented is a 'clean-room' design of my own that to the best of my
knowledge is the only one to also offer a time-delay for the LCD back-
light. Having said that, let me say:

I ASSUME NO RESPONSIBILITY FOR ANYTHING THAT
MIGHT HAPPEN TO YOUR RADIO SHOULD YOU OR
ANYONE ELSE ATTEMPT THESE MODIFICATIONS.
WHILE REASONABLE CARE HAS GONE INTO THE
PREPARATION OF THE FOLLOWING DOCUMENT, I CAN
NOT GUARANTEE THAT THERE ARE NOT ERRORS.

The procedure described below is very complicated, and
involves the soldering and desoldering of very tiny components and
the cutting of printed circuit board traces. While the procedure is not
irreversible, it will leave permanent scars inside your scanner. It
should only be attempted by someone with moderate to advanced
electronics experience. I don't think it should be attempted by, to
quote someone else, a "weekend technician." If as you read through
this you feel intimidated by the jargon and required procedures or if an

electronic schematic looks like a strange piece of modern art to you, then this might not be the 'mod' you are looking for. The following document will assume you have obtained the materials listed below, especially the Service Manual, and you have studied the circuit in some detail. I will not describe in great detail where every component is or where every solder point on the logic board should be placed. Having the Service Manual, and having studied the drawings therein will allow you determine to where it is I refer.

REQUIREMENTS

1 - PRO-43 Service Manual. (Tandy Parts # MS-2000300 - approx. $6.00)
1 - CD4053 - Triple - SPDT analog switch - Surface mount package (DigiKey #CD4053BCM-ND - approx. $1.50)
2 - 93C67 EEPROMs (Tandy Parts # MX-8050 - approx. $13.00/each)
1 - 100k x 5 resistor network. Common lead type. (DigiKey # Q5104)
1 - UN2111 PNP transistor (Q1 on Logic PCB. Tandy Parts #)
1 - 1 uF 16v capacitor.
1 - 10 MOhm 1/8-1/16W resistor.
Misc.:
Wire wrap wire-30 gauge. (Radio Shack)
Grounded soldering iron with approx. 1/32" tip or smaller.
Desoldering Equipment.
Digital Volt Meter. (Used to double check your VCC and Ground connections, pre-check switching assembly)
Utility knife with fresh sharp small blade. (Needed to cut traces.)
Strong hand held magnifying lens. (Needed to check solder joints.)
+5-10 Volt bench power supply. (Used to check switching assembly.)
Anti-Static work place and grounding wrist band.
Very fine needle nose pliers, wire cutters.

THEORY

When studying the schematic for the PRO-43 one sees that the channel memory is organized using two 93C67 EEPROMS. As is common in microcomputer designs, the memory is all connected together on a common bus, with the individual memory devices being selected with a Chip-Select (CS) control line. The 93C67 are particularly simple, in that they are serial devices, only requiring 4 signal lines. (Data In, Data Out, Data Clock and CS) This inspired me to consider the possibility of adding two more EEPROMs, creating in effect a second 'bank' of 200 channels. One could then, presumably with the flip of a switch, choose between the original 200 channels, and a second bank of 200 channels. (In theory, this could continue to 600, 800, 1000 etc. channels. In practice however, space is very tight in the PRO-43, and getting anymore memory installed would be very tricky.)
Switching two CS lines between two pairs of EEPROMs requires the equivalent of a DPDT switch. While it might be possible

to do this with a mechanical switch, the physical implementation of this could prove to be very difficult. Rather than use a DPDT switch, I chose to use a CD4053 triple 2 channel analog multiplexer/demultiplexer. This CMOS analog 'mux/demux' can be viewed as a triple SPDT switch. Two sections of the CD4053 are wired in such a way as to act as a DPDT switch. The advantage being that a DPDT switch can be controlled with a SPST switch, and no actively switching digital signal lines need leave the area of the CPU. At this point one is still faced with the need of a mechanical switch to control the CD4053, albeit, only a SPST switch is needed. It was suggested to me by someone on the Internet, that the 'Keylock' switch might be a good candidate. And indeed it is! While it might be nice, once in a while, to be able to disable the keyboard, it is more than a fair trade to give this up for more memory. Thus I used the Keylock switch to control the DPDT switch made from the CD4053.
Good design dictates that the state of all signal/control lines are always in a known state. The 93C67's CS lines are active high leading to the need for pull-down resistors on all 4 CS lines. This insures that the 93C67's not currently being used will have their CS lines pulled to ground. I accomplished this with 100K ohm resistors connected between the CS line and ground. Physically I implemented this using a resistor array (SIP package) containing 5-100K resistors all having one common lead. The 5th. resistor is used to pull-down the CD4053 control lines making up the DPDT switch. This is necessary when the Keylock switch is in the open position (unlocked) since the line must be driven low.
This leaves a SPDT switch in the CD4053 not being used.
Studying how the lamp circuit works shows that the keyboard light switch grounds the base of Q1 to turn on the lamp. Using the CD4053 to act as the switch to ground, and placing a large RC time constant circuit on the control line of the CD4053 will allow for a time delayed lamp modification. Because the input impedance of the CD4053 is extremely high, a small valued capacitor and large value resistor will work. In my design I used as 1 uF tantalum capacitor and a 10 MOhm resistor to form the RC time delay. The Pro-43's keyboard light switch is connected across the capacitor to discharge it when depressed. This causes the CD4053 to switch on, grounding the base of Q1. After the switch is released, the capacitor begins to charge through the 10 MOhm resistor. When this voltage reaches approximately 1/2 VCC the CD4053 switches off, and the lamp goes out. (One caveat: When the radio is first turned on, the capacitor is discharged and therefore a lamp timing cycle will begin with each power up.)

PROCEDURE

REMEMBER TO ALWAYS WORK AT A STATIC FREE WORK-STATION, INCLUDING THE USE OF GROUNDED SOLDERING EQUIPMENT AND THE WEARING OF STATIC REMOVAL BRACELETS.

The first step is to build the switching assembly. To build this first tin the leads of the surface mount CD4053 and the resistor array. Following the connections shown in the schematic (figure 1), attach short (3/8" to 1/2") pieces of wire wrap wire between the 5 resistor leads of RA1-NEW and pins 1,2,3,5, and 9-10 on the CD4053. (You should always: Size, cut, strip, tin and trim the wire before soldering it to the CD4053. Doing this makes it fairly easy to get good solder connections.) Connect the common lead of the resistor array to pins 6,7,8 and 12 of the CD4053. If done correctly you will have the resistor array laying flat on its side with its leads facing the CD4053 as shown in figure 2. This makes the assembly very thin. Inspect the solder joints with a magnifying glass, and give them a gentle 'tug' to make sure they are securely soldered. The PCB board drawing on page 19 of the service manual is an actual size drawing. Check to see that your assembly will fit into the area just above IC1 and to right of IC2.

Soldering to the pins of RA1-NEW, connect 4 - 2.5" lengths of wire to the resistor leads going to pins 1,2,3&5 of CD4053 (This makes up the 4 switched lines going to the CS pins.) Connect a 5" length of wire to the resistor pin connected to pins 9&10 of the CD4053.(This will go to the Keylock switch.) Attach a 2" piece of wire to the resistor lead attached to pins 6,7,8 & 12 of the CD4053. (This will be the ground connection.) Attach 3 - 4.5" long wires to pins 4,15,&16 of the CD4053. These will be the two poles of the switch and the VCC connection respectively. Finally attach 2 - 5" wires to pins 11 & 14 of the CD4053 if you intend to also add the lamp timer modification. At this point you should have a strange looking device with 11 wires sticking out of it. DOUBLE CHECK YOUR WORK AND SOLDER JOINTS AT THIS POINT.

The next step is to check the operation of the switching assembly. Using a 5-10 volt power supply, apply power to the assembly. Using a DVM, check to see that there is continuity between pins 4&5 and pins 15&2 while the control line (the wire attached to pins 9&10) is not connected to anything. And also check to see there is NO continuity between pins 4&3 and 15&1. If that checks, attach the control line to VCC. There should then be continuity between pins 4&3, and 15&1 and no continuity between 4&5 and 15&2. Next check for continuity between pin 14 and ground when pin 11 is grounded. The resistance between 14 and ground should become infinite when pin 11 is then connected to VCC. After check-out put the assembly aside in a static proof container.

Using extreme care bend all the leads, EXCEPT FOR PIN 3, of one of the 93C67 so that they are pointing as straight DOWN as possible . Bend pin 3 so it is sticking straight out from the body of the chip. These leads are very fragile and I suspect they will only accept a single bending before breaking,. After the leads are bent, carefully tin all leads. Put the EEPROM back in its carrier, and repeat on the second EEPROM. The next step is to prepare the scanner for the switch assembly. From here on out, "The cheese becomes more binding," so work carefully and think about everything twice before doing it!

Remove the battery compartment lid and battery. Remove the
4 case screws and the back of the case. Disconnect the two wire
connectors on the RF board. Desolder the antenna feed line and its
ground connection. Remove the 6 screws holding down the RF board
and remove it from the audio board. Disconnect the speaker wire from
the audio board, and remove the 2 screws holding it to the front of the
case. Separate this from the front of the case. Desolder and remove
the RF-shield from the logic board. Wash your hands to remove as
much skin oil as possible! Remove the screws holding the logic PCB.
Turn the unit over, and with your hand supporting the PCB lower it
from the case front. The reason for this is that the LCD assembly will
stay with the board. If during this process the LCD and its backing
glass do separate, handle them as little as possible. Also note the
back-glass has a white frosted side. The frosted side, the light diffuser,
is placed away from the LCD panel. Remove the rubber keypad, and
locate the two traces running to the Keylock switch. Using a sharp
utility knife, cut both of these traces near the switch, examine the cuts
with a magnifying lens to make sure the switch is severed from the
rest of the board. Avoid touching the keypad contact area as much as
possible. Checking to make sure dust has not entered the LCD view
area, put the logic PCB back in the front of the case and secure it with
its screws.
Locate IC2 and IC3 EEPROMs on the logic board. Add to
each of the pins on both chips a small amount of solder. This will be
necessary to attach the new EEPROMs. Of course you must make sure
that you form no solder bridges. At this stage I suggest you re-install
the audio board and RF board. (There is no need to solder the RF
shield back on, nor should you resolder the antenna connections.) By
holding the battery in place and slipping the battery lid into proper
position, it is possible to power up the radio without bothering with the
case back. Check to see that all keys are functioning correctly except
for the Keylock switch, and that the display looks normal. You are
now ready to begin the 'fitting' of your switch assembly into the radio.
Locate the area just above IC1 and to the right (as being
viewed from the backside of the radio) of IC2&3. There is a relatively
open space here where the CD4053 and resistor array can lay. Cut a
piece of thin card board stock to be slightly larger than the area taken
up by the switch assembly. This will serve as an insulator between the
logic PCB and the assembly. Keeping the assembly in its final
position, start sizing the lengths of the wires. The wires connected to
pins 1&2 of the CD4053 must reach IC3 pin 3, and the wires on pins
3&5 of the CD4053 must reach IC2 pin 3. Remember when cutting
these down to leave enough extra wire for stripping, tinning and final
trimming. The wire connected to pin 15 of the CD4053 must be long
enough to reach the TRACE on the PCB going to IC3 pin 3. Likewise
the wire on pin 4 of the CD4053 must reach the trace running to IC2
pin 3. The switch control wire (pins 9&10 of the CD4053) must reach
down to outside most solder pad on the Keylock switch. VCC, pin 16
of the CD4053, is sized to reach the 82 ohm resistor R26 located next
to Q1. The ground connection can be made on the large copper area

under the switch assembly after scraping a small area of solder-mask off. After the wire lengths have been determined, strip and tin the ends of all the wires and set the assembly aside.
Using a sharp knife, cut the trace running from IC1 to pin 3 of IC2. Repeat this for the trace running from IC1 to pin 3 of IC3. On either side of the cuts, scrape off a 1/8" area of solder mask and tin the exposed copper. Be careful not to damage any of the surrounding traces or components. Place the switching assembly in its proper location and solder the ground wire to the solder-mask free area you made near IC1. Attach VCC (pin 16 of the CD4053) to the top of R26. Attach the pin 5 wire to the cut trace that runs to IC2-pin 3, and attach the pin 2 wire to the cut trace running to IC3-pin 3. Next attach the wire on pin 4 of the CD4053 to the trace running to pin 18 (previously running to IC2-pin 3) of IC1. Likewise connect the wire on pin 15 to the trace connected to pin 19 (previously running to IC3-pin 3) of IC1. If done correctly you now have 4 wires running to the four 'new' connection points made by cutting the two CS line traces. Connect the wire tied to pins 9&10 of the CD4053 to the outside (left side) conductor of the Keylock switch. Attach a new piece of wire to the center conductor of the Keylock switch. Size and connect the other end of this wire to center lead of IC5. (IC5 is low battery detector for the CPU. The center lead of this is connected to 5 volts which is sufficient to switch the CD4053. Later we will need to attach another connection to R26, and squeezing 3 wires to this single point would be tight so I used the 5 volt bus for switching.)
Place the insulator under the assembly and tape a corner in place so it will not move. Cut another cardboard insulator big enough to cover the switching assembly, and place this on top of the logic PCB. Bending the currently disconnected wires (pins 1,3,11,&14) in such a way that they don't short to anything (or each other) , install the audio board back in to the radio. Install the RF board and prepare to power up the radio. Making sure the Keylock switch is in the UNLOCKED position, turn the radio on. It should begin to scan normally. (Believe me you will breathe a big sigh of relief when it does!) Turn the radio off, move the Keylock switch to LOCKED position and turn the radio back on. You should see it either scanning frequency 000.0000 or the frequency field will be blank, with the channel counter incrementing. After a few seconds, the frequency number always blanked out and the am/fm indicators blinked randomly on my radio. If you are unable to make the radio scan correctly, there is something wrong with the switch assembly or your connections.
The next step is to install the new memory. The leads on the new memory are not long enough to reach the leads of the factory memory. Trying to solder bridge the gap is difficult accomplish without also bridging adjacent pins. The best way I found to do this is to use tinned wire wrap wire. So the first step here is to tin about 6" of stripped wire wrap wire. Remove one of the new 93C67s from its carrier and place it on top of IC2, making sure that the extended pin 3 is over pin 3 of IC2. Put a droplet of solder on the tip of your

soldering iron. While holding down the memory with a finger, apply the soldering iron to one of the corner pins of both ICs. The droplet should 'jump' over the gap between the pins and solder them together. Check both sides of the EEPROM to insure that all pins are accurately aligned. For the remaining straightened pins, proceed as follows: While holding the tinned wire wrap wire against the lower and upper pins, apply a freshly cleaned soldering iron tip to the gap area of the joint. The extra solder you earlier placed on the factory EEPROM will then be available to flow along the wire and solder to the pin of the new EEPROM. CHECK the joint with a magnifying lens. After a visual conformation of the joint, clip the wire close to the pin of the newly installed memory. If you like go back to the first pair you soldered and lay the wire into the molten solder. Repeat for IC3. Attach the wire connected to pin 3 of the CD4053 to pin 3 of IC2-NEW, and connect the pin 1 wire to pin 3 of IC3-NEW. Install the cover insulator over the switch assembly and prepare for a power up. With the Keylock switch in the Unlocked position power up the receiver. After insuring that the factory memory is still working correctly, power down, switch to the Locked position and power up again while holding down the 0 key and the Clear key. You should now see the radio scanning frequency 000.0000 for all 10 banks repeatedly. Press the PGM key to stop scanning and enter a valid frequency value and press enter. Press PGM, then the DOWN-ARROW, then PGM again. The frequency you just programmed should now be on the display. (At this point feel free to cheer! YOU have just added 200 more channels to your PRO-43. The next step will be the icing on the cake!)

This next step requires you to lift the BASE of Q1 from the logic PCB. (I found this to be very difficult, in fact, I ended up destroying Q1. Thus the extra Q1 in the parts list.) Desolder and lift the Base lead of Q1 from the logic PCB. Solder together one lead of R2, the positive terminal of C1 and the wire from pin 11 of the CD4053. Also from this junction, connect a wire to the solder pad on the logic PCB where Q1's base was connected. The area to the right of the Keylock switch provides a space where these components can lay. Connect the base of Q1 to the wire connected to pin 14 of the CD4053 switch assembly. The other end of R2 is connected by wire to the top of R26, this provides the charging voltage for C1. The negative lead of C1 can be connected to the RF shield ground pad near the Keylock switch. (Check that the RF shield will fit in place over C1. If it will not, place C1 so that its body is just below the bottom of the shield. Insulate the R2-C1 combination with electrical tape. Tape the switch assembly's top insulator cardboard in place and install and solder the RF-shield back onto the logic PCB. Prepare the radio for bench power up.

Turn the radio on, the lamp should come on. After 7 to 10 seconds the lamp should go out. Check in a darkened room to insure that the lamp completely extinguishes. Depress the light switch on the keyboard. The lamp should immediately light, and stay lit for 7 to 10 seconds after it is released. Install all the remaining screws for the RF

board, solder the antenna lead and ground connections, and replace the case back.

USAGE

The light feature is self explanatory, and quickly finds itself useful in darken conditions. As noted earlier an unfortunate side-effect of the lamp circuit design is that the lamp will illuminate for 7 to 10 seconds every time the scanner is first turned on. (Maybe this is a feature to some.) Switching between active banks requires a little more thought. The safest way of changing banks is to: Turn the scanner off, switch banks, and then turn the scanner back on. But sooner or later you will switch banks while the scanner is on. When this happens you will see a curious event. The radio's CPU will continue to scan from the previously selected banks, but the frequencies scanned will now be those from the on-line EEPROM. This makes sense, since the CPU has no knowledge that its memory resources have been changed. Pressing the Manual button, followed by the Scan button, will cause the CPU to reload the scan banks that were last saved in the currently selected EEPROMs. Also any monitor frequencies that were stored are recalled. This allows you to set up two different frequency configurations, one in each bank of EEPROM. To change between them on the fly, just flip the Keylock switch, press the manual button, followed by the scan button. The only time I can foresee there being a problem is if some how one were to flip the switch while the CPU was doing a write to EEPROMs. Keeping this in mind you should never have any problems.

There are a couple of 'gotch-ya' that can happen when switching memory banks without cycling power. The PRO-43 loads the list of all locked-out channels only when it is first powered up. (This makes sense if you think about it. While I don't know for a fact, I assume that the Lock-out information for each channel is stored together with that channel's frequency in the EEPROM. If the CPU didn't pre-load the list of locked out channels, it would have to constantly re-read each channel to determine its lock-out status.) The side-effect of this is that it can cause the radio to appear to be randomly locking and unlocking channels when switching memory on the fly. The only realistic solutions appear to be to either cycle power when you switch memory banks, or use Lock-outs very sparingly. The Priority channel assignment is also loaded only when power is first applied. This can make the radio start checking the wrong frequency when memory is switched and the priority feature is used. The best way around this problem seems to be to assign the same channel number to be the priority channel in each memory bank.

CONCLUSION

Performing the described modification will provide the owner of an already excellent hand-held scanner, the convenience of a total of 400 channel memories and 20 monitor locations, doubling the factory capacity for under $40.00. It also provides a "fade away" LCD back-light with a 7 to 10 second delay. The bank switching nature of the design allows for the user to program two unique 'personalities'

into the scanner selecting between them with the Keylock switch. The modification while complicated can be performed by any person with moderate to advanced electronics experience.

I got the old version of the Ramsey SS-70 and had to modify it to work.
I hope the SS-70 is better. The kit is $39.95 and the matching case is
$14.95. They'll sell it to you assembled with case for $79.95. Their
number is 1-800-446-2295. Ask them for a catalog. Most of their stuff
is junk and needs modifications. If you're technically inclined it is
not a problem.

By the way, has anyone tried the NEW SCA decoder (SCA-1) for $27.95?
I don't have a receiver capable of tuning below 100KHz so I was thinking
about trying this one. I guess I need the SCA mod for the 2006 too :-)

Having a color map of most of the local transmitters is truly wonderful! Driving by antennas for years made me curious as to the frequency and the ownership. For example, I now know who owns the huge towers a few miles from my house (AT&T) and what frequency is used. Also, as I am interested in pager technology, I have quickly identified the Skytel transmitter locations!

This is now possible (much easier then digging through multiple databases) through Bob Parnass' RadioMap(tm) service. Knowing Bob and respecting his radio knowledge, I quickly sent him a check and asked him to identify transmitters in my immediate area. He looks at the density of transmitters and determines the overall radius (for the Chicago loop area, he can only diagram a small radius due to the density while a rural area he can expand the radius to 10 miles or so) and plots the output. He returned a nice map with a linear list of transmitters within a week.

Overall, the RadioMap is a good deal and now I KNOW (instead of guessing) where the transmitters are!

Specifics: RadioMap(tm), Bob Parnass, 2350 Douglas Road, Oswego, Illinois, 60543-9794, $19.95

(I have no affiliation with the RadioMap(tm) product, just a pleased customer)

Get hold of these folks and get a catalog:
REAL GOODS
966 Mazzoni St.
Ukiah, CA. 95482-3471
800-762-7325

They have a 4-AA solar charger, order # 50-201 for $14
The catalog does say however, that it will take 2-6 _days_ to fully charge a set of nicads (it's got a 90ma panel). They've got a "High Powered" solar charger that will do a pair of C, D, AA or AAA nicads at 330 ma. That one is available as a complete unit (#11-130) for $19, or as a 4.7v 330 ma panel alone for $12.

Disclaimer: I've got nothing to do with Real Goods except as a happy customer.

ATTenuate. When the receiver get overloaded from very strong close by
signal, the ATT switch will put things straight. Don't use it unless you
have to. Leave it set on 0db.

|> and what kind of reception or distance or what I will get with it??....
|>
|> I am not familiar with external antena's.....is this a good one for me?

The Yagi type antenna may not be a good choice for general purpose
scanning for a few of the following reasons:

1) The Yagi is directional so you will need to point it in the general
direction of the station you wish to monitor. Stations to the sides
and back of the Yagi antenna will be severely attenuated. The
"narrowness" of the beamwidth will be dependant on the number of
elements. More elements will give you more gain but you will have
to "aim" the antenna more precisely because its beamwidth will be
narrower.

2) In general, the Yagi is a relatively narrow-band antenna which will
provide plenty of gain over a relatively narrow band of frequencies.
Unless you need this additional gain within the frequency band the
Yagi was designed for, you will probably be better off using a
broader bandwidth antenna like a discone or even a simple outdoor
whip.

A log-periodic antenna which looks similar to a Yagi may be a better
choice for scanning. While all of the elements of a Yagi antenna are
about the same length, the log-periodic antenna will have tapered
element lengths --- like a TV antenna. Basically, the tapered elements
give the log-periodic a much broader frequency bandwidth but reduced
gain and broader beamwidth. It is still a directional antenna but the
trade-off is greater bandwidth at reduced gain. You'll still have to
"point" this antenna in the general direction of the station you wish
to receive.

My ideal setup:

1) Omnidirectional broadband antenna placed very high on my rooftop
for general purpose monitoring.

2) Directional antenna like a Yagi or log-periodic placed on a TV antenna rotator on my rooftop.

Use the omnidirectional antenna for general monitoring. If I hear a weak signal that I'm interested in, switch to the directional antenna and rotate it until the signal strength increases to a useable level.

3078. The Radio Spectrum - 3rd Revision

Newsgroup: rec.radio.scanner
Date: 1994-10-01 00:20:58 UTC
From: g9153402@huey.csun.edu
Message-ID: <36ia1a$fuf@nic-nac.CSU.net>
Source record: 268021
Cross-posted to: rec.radio.scanner,rec.radio.shortwave

OK. Here is my third revision of this list, as astute readers showed me some more minor errors. But remember, I intended this to be an approximate guide, maybe to just paste on the wall to refer to as you are scanning the frequencies. It isn't (and can't) be some extensive guide to frequency locations, like the book Police Call.

Have fun,

Berton Corson
Northridge, California

THE RADIO SPECTRUM

This is an approximate look, to help in searching frequencies on a scanner or shortwave radio. Just be aware, having the right frequency may not be enough, in tuning to a certain frequency. The time of day, atmospheric conditions, location, mode you're in (AM, SSB, Narrowband FM, Wideband FM, etc.), and your equipment, are also equally important. You'll find most transmissions are broadcasted in Narrowband FM. Some main exceptions are shortwave (AM & SSB), commercial AM radio (AM), commercial FM radio (Wideband FM), television (Wideband FM), citizens band radio (AM & SSB), aeronautical communications (mostly AM), and some military VHF/UHF (Wideband FM). Most all scanners will pick a default mode for you, depending on what frequency band you are in. But many scanners also let you manually switch between modes (AM, FM, etc.) and frequency search spacing (5 khz, 12.5 khz, etc.) if the default modes are not correct. Happy Listening!!!

FREQUENCY USES/SERVICES
(in Megahertz unless
otherwise indicated)
---

10 - 150 khz Military/government, submarine
(.01 - .15 MHz) communications.

150 - 535 khz Longwave Band, beacons, foreign broadcasts,
(.15 - .535 MHz) maritime.

535 - 1700 khz Your standard AM radio dial.
(.535 - 1.7 MHz)

1.7 - 30 Shortwave/High Frequency Band. Broadcasting,
two-way government, military and commercial
communications, amateur radio, CB radio (approx.

27 MHz), others.
Shortwave - Approx. Range Meter Band
1.8 - 2.0 160*
2.3 - 2.495 120
3.2 - 3.4 90
3.5 - 4.0 80*
3.9 - 4.0 75
4.75 - 5.06 60
5.9 - 6.2 49
7.0 - 7.3 40*
7.1 - 7.35 41
9.4 - 9.9 31
10.1 - 10.15 30*
11.6 - 12.1 25
13.57 - 13.87 22
14.0 - 14.35 20*
15.1 - 15.8 19
18.068 - 18.168 17*
17.48 - 17.9 16
18.9 - 19.02 15
21.0 - 21.45 15*
21.45 - 21.75 13
24.89 - 24.99 12*
25.6 - 26.1 11
28.0 - 29.7 10*
(In general, the lower shortwave frequencies
<higher meter band> are received better during
the night, while higher frequencies are re-
ceived better during the day. There are also
some amateur radio bands between many of these
shortwave bands(*). Consult a shortwave guide
for more detailed information.)

30 - 50 Very High Frequency Band. Government, business,
walkie-talkies. Also, cordless phones and
'baby monitors' found about 46 - 49 MHz.

50 - 54 Amateur radio 6 meter band.

54 - 72 TV Channels 2-4.
Channel 2 Audio (Wideband FM) 59.75
Channel 3 Audio (Wideband FM) 65.75
Channel 4 Audio (Wideband FM) 71.75

72 - 76 Manufacturing, remote control, eavesdropping
bugs, etc.

76 - 88 TV Channels 5-6.
Channel 5 Audio (Wideband FM) 81.75
Channel 6 Audio (Wideband FM) 87.75

88 - 108 Your standard FM radio dial.

108 - 136 Aeronautical communications (AM).

136 - 138 Satellites.

138 - 144 Military communications.

144 - 148 Amateur radio 2 meter band.

148 - 150.8 Military use.

150.8 - 174 Business, highway, law enforcement, government, weather, maritime.

174 - 216 TV Channels 7-13.
Channel 7 Audio (Wideband FM) 179.75
Channel 8 Audio (Wideband FM) 185.75
Channel 9 Audio (Wideband FM) 191.75
Channel 10 Audio (Wideband FM) 197.75
Channel 11 Audio (Wideband FM) 203.75
Channel 12 Audio (Wideband FM) 209.75
Channel 13 Audio (Wideband FM) 215.75

216 - 220 Maritime and aeronautical.

220 - 222 Land mobile communications.

222 - 225 Amateur radio.

225 - 400 Military aviation and space.

400 - 406 Military and government.

406 - 420 U.S. Government.

420 - 450 Amateur radio.

450 - 470 Ultra High Frequency Band. Business, industry, military, fire, government.

470 - 512 TV Channels 14-20, shared with law enforcement.

512 - 824 TV Channels 21-69, others.

824 - 849 Cellular telephones (receivers/handsets).

849 - 851 Aeronautical telephones (ground-based towers).

851 - 866 Business, public safety, trunked systems.

866 - 869 Public safety, law enforcement, trunked systems.

869 - 894 Cellular telephones (towers).
Note: Even though listening to cellular telephone calls is technically illegal in the United States, one will usually do better listening to calls on the tower frequencies, as opposed to the handset frequencies. This is because most cellular phones transmit less

than one-watt of output. So unless the cellular phone is very close to you, you will have much more luck scanning the more powerful towers, which transmit/receive for each cell site.

894 - 896 Aeronautical telephones (handsets). Note: In scanning airplane telephones, you will usually do better listening to the handset frequencies, instead of the tower frequencies, unless you are very near a ground transmitter. But, in any event, call traffic heard on handset frequencies is very scant.

896 - 901 Private land mobil units.

902 - 928 Land mobile, amateur radio, personal communication units, cordless telephones.

928 - 932 Radio paging.

935 - 940 Business radio.

941 - 944 Government and non-government fixed services.

944 - 952 Broadcasters' studio-to-transmitter links.

952 - 960 Private fixed services, paging.

960 - 1240 Aeronautical navigation.

1240 - 1300 Amateur radio.

1300 - 1350 Aeronautical navigation.

1350 - 1400 Radio location.

1400 - 1427 Radio astronomy.

1427 - 1429 Point-to-point, mobile, space.

1429 - 1660.5 Various satellite transmission uses.

1660.5 - 1668.4 Radio astronomy.

1668.4 - 1700 Meteorological aids.

1700 - 1850 Meteorological satellites, U.S. Government.

1850 - 1990 Fixed point-to-point, microwave.

1990 - 2110 Broadcast studio-to-transmitter links.

(end)

> scanners?. All help is greatly appreciated.

150 khz - 30 mhz is good coverage for a shortwave radio.

25 mhz - 2 ghz (2000 mhz) is great coverage for a scanner, if in fact it
is continuous (very few are, and scanners made after April of this year
aren't supposed to be cellular modifiable (parts of the 800 mhz band).
I don't know about the Icom 7100, but I would bet most of your searching
will be in the 25 thru 950 mhz range. There really isn't much up there
in those higher frequencies to listen to. ...At least I've never found
much.

3080. Secret Service Freqs... AM or FM?

I've recently purchased a Radio Shack Mod 2032. A local store had a batch of these for $199. I checked this and last year's catalog and it's not listed. I've been lurking here faithfully for any info on this thing, but have not seen any postings. Sooo, what in the heck do I have? Is it a relativly current model? And of course, is it mod-able?

Chris Van Fleet says:
" The next test was in the cordless phone band, ie. 46 MHz. With the
" PRO-41 scanning over 46.870 MHz and the 2006 tuned to 36.17 Mhz the
" distinctive chuffing noise could be heard thru the 2006's speaker.
" When I turned the PRO-41 off though, there was still a chuffing
" noise although weaker and not as fast. Why? I assume this means there
" is another scanner scanning through 46.870 MHz nearby.

Could be...

" Next:
" - more testing on the range over which the PRO-41 is detectable
" - we'll try to track down the SCANNER SCUM monitoring the cordless
" phone frequencies nearby. We have a HAM living behind us, I'll
" bet that's who it is.

Yep. You know how those dastardly HAMS like to drool over those hot 900
calls made over your cordless... :)

The Brits use similar technology to check on the use on unlicensed
television receivers. Probably those TV AUDIO SCUM who are trying to
avoid paying shillings into the British Postal Service coffers.

Out here on the west coast HBO used vans to search for the IF of pirate
SCUM who snatched the signal from their unencrypted mountaintop
repeaters. They sent cute little letters to try to intimidate those that
they found. Some coughed up the money demanded by HBO. Others told them
to go pound RF waves into their dummy loads.

Why does a scanner tuned to 46 - 49 Mhz make someone a SCANNER SCUM
while the same receiver tuned to 54 Mhz make one a TV hobbyist? If you're
offended by the fact that technology has left your phone conversations a
little less private why don't you use the ultimate countermeasure - a
phone with a wire on it...

Sheesh... I hope you're not one of the folks who sleeps better at night
safe in the knowledge that the ECPA will make everything right with the world
of wireless communication!

just another opinion from one of those HAM SCUM... :) KC6IFF

3085. question about elderly PRO-2004

Newsgroup: rec.radio.scanner
Date: 1994-10-01 05:10:06 UTC
From: lfs@netcom.com
Message-ID: <lfsCwzACu.LLw@netcom.com>
Source record: 267967

I saw a slightly grungy PRO-2004 scanner for a decent price in a pawn shop yesterday. The keypad seemed a little low-budget to me, but it's supposed to be a good scanner from what I've read. However, the one thing that didn't appear to work was the "." key! In other words, when I'd try to key in 162.55 it would read it as 1625 (max of 4 digits left of decimal point). Also, there was no beep when I hit the "." key (but the key action felt OK). Are my habits with my cheap little 855XLT blinding me as to how to key in a freq on the 2004? If that's not the case, what are the odds that I can still get a replacement keypad (and would I have to be Superman to replace it?)? I wouldn't bother, but the files on oak with all those 2004 mods make it tempting... %)

Please email, as netcom's news feed is rather sluggish at the moment. If there's interest, I can post any info I get. Thanks.

It is an attenuator switch, for I believe 10db reduction in rx signal.
Useful in major RF jungles like NYC, etc.

Good luck with your scumbusting, but I bet your track will lead you right to the cordless phone itself, rather than to some scanner scum monitoring it. After all, cordless phone handsets contain receivers which monitor the 46 MHz base signal, and their receivers have IF's and local oscillators too. As for the chuffing (pulsing) of the signal, that is characteristic of a battery saver circuit just like those employed by some ham handhelds. When the receiver hears no signal for a period of time, it goes to "sleep" and just fires up briefly once every second or so to check the frequency for activity.

Many scanners and radios emit local oscillator (LO) signals which can be picked up for quite some distance. I've been able to identify several scanners monitoring the local PD by listening for their LO's. I can also tell when a police cruiser is within a block or so of my location if I'm monitoring the LO frequency of its radio. I even found the frequency of a particular business once by using my handheld scanner to search scan for the LO frequency of one of its radios. I was standing about 100 feet from an employee carrying a Motorola HT-90 UHF portable, which I knew had a 1st IF of 21.4 MHz. I guessed the business operated in the 461-465 MHz range, and search scanned 21.4 MHz below (439.6 MHz - 443.6 MHz) until the scanner stopped on the Motorola's LO frequency. Then I just added 21.4 MHz to come up with the operating frequency; and the guy never even had to transmit for me to find it.

There are other amusing tales of LO radiation. A friend of mine who used to have a UHF ham repeater right next to a busy boulevard found the repeater was keyed up every weekday morning by a carrier that would fade in and fade out about 30 seconds later. The same thing would happen every weekday afternoon. After some calculations and systemmatic observation, we concluded that someone who commuted to work every day on the boulevard

and listened to the FM station whose audio we were hearing had a car radio with very leaky harmonics of the LO, one of which fell on the repeater's input frequency. I once used the LO of a BC-210 scanner to key up a 2 meter ham repeater about 1/3 of a mile from my former QTH. Police in some states have used radar detector detectors which listen on radar detectors' LO frequency to tell whether a motorist is using a radar detector. And I've heard via the net that authorities in the UK (where every TV set must be licensed) use equipment that detects local oscillators of television sets to locate unlicensed sets. So while scanners are generally among the worst offenders when it comes to LO leakage they are by no means the only offenders.

3090. FCC License Data Sources

Newsgroup: rec.radio.scanner
Date: 1994-10-01 07:00:23 UTC
From: bill@thd.tv.tek.com
Message-ID: <36j1e7$asa@news.tv.tek.com>
Source record: 267933
Cross-posted to: rec.radio.scanner,rec.radio.info

[last changed 05-Jul-94]

Changes preceeded by "|". Please e-mail corrections and additions to me.

INTRODUCTION

This is a list of FCC license data sources available to scanner listeners. The FCC master contains a wealth of data about every non-government license in the United States. Most of the sources below contain a subset of this data, although a few contain all of it. Government licenses are not administered by the FCC, and the data is not available to the public.

If you are interested in purchasing the data, you might want to consider forming a co-op of people in your area to share the cost. As far as I know, this is legal since the information is in the public domain. However, most software supplied to view or manipulate the data is copyrighted and must be purchased separately by each user.

Prices are rounded to the nearest dollar and include shipping, if known.

C.E.T.

CET sells records of all stations inside a 30-mile radius for $80. (Major cities cost extra.) A 70-mile search costs $178. The data is provided on floppy disks and is available in ASCII columnar and comma-delimited formats.

CET does not provide data for licenses that do not contain specific geographic coordinates (i.e., mobile-only systems) or specific operating frequencies (e.g., amateur radio).

To do the search, CET requires the latitude and longitude of the center of the 30-mile radius. I calculated mine from a USGS topographic map I obtained at a local nautical supply store. Alternatively, you can obtain the coordinates for your town from the University of Michigan's geographic name server. Run "telnet 141.212.99.9 3000" and enter your zip code. For my area, the server returned the coordinates of the main post office.

CET can be reached at 800-445-0297.

GROVE

Grove sells FCC data on disk by state. The first state is $40, and each additional state is $30 (add $10 for CA, FL, TX). The disk comes with a database search program. Grove Enterprises can be reached at 800-438-8155.

MICROFICHE

The Bearcat Radio Club sells the FCC master by state for $15. Bearcat Radio Club can be reached at P.O. Box 291918, Kettering OH, 45429.

PERCON

PerCon sells a variety of FCC data on CD-ROM and floppy. CD-ROMs are available by region or category, and floppies are available by state. Also available is a CD-ROM of the entire US (2.5 million records). Data is updated approximately every six months.

State floppies are $60 per state (add $5 for CA, FL, NY, TX, PA, OH, IL). Regional and full US CD-ROMs are $105 each. CD ROMs by category are $155 each. Quantity discounts available. PerCon can be reached at 716-386-6015.

POLICE CALL

This is probably the most cost-effective source of public service license information. The detail is limited, but the information that is there is often more useful than the FCC master. For example, an entry in Police Call that reads, "Portland Police, Net 3, North Precinct," reads, "Portland, City of" in the master.

Police call is available in 9 volumes covering different regions of the US. It can be purchased at Radio Shack stores for $10 per volume.

SCANWARE ASSOCIATES

ScanWare Associates sells a PC-based database program called the FCC Frequency Retrieval System V2.0. It comes with FCC data for one state, covering all services from 10 kHz through 2036 MHz. Data is updated approximately every six months (last update was Dec. 1, 1993).

Cost is $35 for the first state and $20 for each additional state. (Add $5 for CA, FL, TX, NY.) Quantity discounts available. Fully working shareware copy downloadable from their BBS at 206-871-4228 (FCC200.ZIP). ScanWare Associates can be reached at 206-698-1383 (voice) or 206-698-8207 (fax).

Switched off, about as far as you can see it !
Switched on and if you know where to look, about 300 ft with decent antennas
and clear line of sight.

The "if you know where to look" is the kicker. The strongest signal from the
scanners I've played with is the first LO, probable because it finds it's
way onto the antenna. With a spectrum range of SW to high UHF that LO covers
a vast range. If the scanner is scanning it'll be jumping, too.

That's passive detection. Active detection is a whole different game. It also
means that you're playing in the pro league or got *very* unlucky.

Most people caught scanning illegally have done something stupid, like acting
on what they heard in an obvious manner.

True. A while back I bought this very cheap SW radio that was on sale.
The radio dial for the FM band goes from 88 - 136 mhz! In the instructions
it explains that you get the 'air band' above the FM frequencies, if
you keep turning the knob past 108. Yep, you are in the air band, but
not being able to switch to AM means you won't be able to understand a
thing...!

3095. Need Help with Computer Hook-Up

I would tend to think if it was a 'police dog search' the
sentence would go more like 'do you need A PDS unit over there'.
Around here (Dayton oh usa) your lucky to get one dog to
show up.

Maybe PDS stands for 'Police Donut Service'. just a guess.

Do you know if the 7100 can receive the NOAA APT/AVHRR signals with success? I am not familiar with the bandwith on this unit, satellite signals need to be received within a specific bandwith. Looking into recommending this unit to a friend that wants to receive APT/AVHRR signals without the cost of the R9000.

Thanks

IF it's an older ICOM or a newer one that has been mod'd. Remember that some dealers don't automatically "open" the programing capabilities, This is especially true of someone who seems less than knowledgeable at land-mobile or GMRS uses. I a gut comes in and says I want a radio on such and such freqs and never mentions anything else......

I know my supplier will only do it for public safety personnel and the media.

There seems to be a lot of Radio Shack bashing on this newsgroup. I have a few comments:

The RS in my area seems to have what I need when I need it in a hurry. Their hours are longer than the more technically inclined electronics suppliers. There are mis-informed sales persons in every type of store. Since there is so much more to know about electronics, and it is much less obvious than, say, pool tables, there will be more mis-informed sales persons in electronics stores. If RS hired real EEs you couldn't afford anything in there (and they wouldn't be less mis-informed, just more convencing).

Once again I'm posting to the group to try and find people who live in or around Springfield, MO that want to share freqs they've found. So far I've met up with two others and between us we have QUITE a list. We're down to the point where the one's that we need now are the harder to find ones. If you're interested, regardless of what you have, E-mail me at soliver@ozarks.sgcl.lib.mo.us and we'll see what we can share...

:-)

PS- do not mail anything to shawn4sk1@aol.com- I won't see it...

3105. Re: Detecting scanners

Newsgroup: rec.radio.scanner
Date: 1994-10-01 18:22:20 UTC
From: mulligan@ACM.ORG
Message-ID: <36k9cs$f09@hopper.acm.org>
Source record: 267890

The PRO-43 is just as detectable as the PRO-41, but its I.F. and local oscillator layout is a bit more complex:

Loc Osc I.F.
1) 640.0-1609.6 608.0-611.2
2) 559.5- 562.7 48.5
3) 48.045 455kHz

The first loc osc is incremented in 3.2 MHz steps as you tune up the band, and the second L.O. tunes within the resulting 3.2 MHz range. For a given received frequency, the 1st L.O. frequency is:

= 611.2 + 3.2 * int[RcvFrq/3.2]

i.e. divide the received freq. by 3.2, take the integer portion and multiply by 3.2, and add 611.2. The second L.O. is outside the range of your PRO-2006 and the third is the same as used in the 2006 (which just receives itself if you try to tune 48.045).

The chuffing noise is the target scanner's local osc passing through the frequency you're watching. If the target stops on the specific freq you'll hear an open carrier noise from the monitoring receiver. The occurance of the scanning ("chuffing") noise on the cordless band offset after you turned off the target scanner was probably a phone in standby mode, checking all ten channels for a signal.

For what it is worrth...
HHere near Kansas Cty this band is very busy during "prime flying
hours", and fairly busy elsewise. "Handset freq" is a bit misleading,
there is another freq for handset to aircraft (ie "intra aircraft),
butthis 894-896 range is a fairly high power xmtr in the aircraft, it is
not directly from the handset in the seat. Very much traffic on
a regular basis.

Thanks for your efforts

Here are the scanner frequencies I was able to verify at
the Dallas Grand Prix 16,17,18 September 1994
The superior (and loud) PA system and very good announcing almost
negated the need for a scanner!

SCCA Corner Workers: 464.425 (I rarely hear them any more at
their old 151.625)

Race Control: 469.925

PRIME Director: 455.675 All the live interviews
sometimes race announcing (but not always???)
sometimes directors calling the shots

WORLD CHALLENGE
488.5625 Mauro Baldi #70 Porsche 911

TRANSAM
468.9750 Ron Fellows #4
469.8500 Dorsey Schroeder #12
466.8875 Jon Gooding #16
468.3500 Brian Semo #22 (Previously Boris Said)
460.1875 Paul Gentilozzi #28
465.8250 Bruce Barkelew #71
463.5125 Ray Kong #87
467.3875 Tim McAdam #94

I never could find Scott Pruett, Jack Baldwin, or Tom Kendall at all,
nor did I find any hints of them being there, but scrambled

For what it is worrth...
Here near Kansas Cty this band is very busy during "prime flying
hours", and fairly busy elsewise. "Handset freq" is a bit misleading,
here is another freq for handset to aircraft (ie "intra aircraft),
butthis 894-896 range is a fairly high power xmtr in the aircraft, it is
not directly from the handset in the seat. Very much traffic on
a regular basis.

O.K. Thanks again.
But in my area (the San Fernando Valley) there is very little commercial
aircraft that is just 'flying over and not stopping' to listen to
air-phone calls. I think I've heard just one air call since I've owned
my scanner. Cellular, though, people just don't stop chatting...

> --
> Larry Spence (lfs@netcom.com)

just guessing here, but on my 2006, I enter MANUAL <channel number> PROGRAM
<frequency> ENTER to put in a frequency. If you don't enter PROGRAM
the scanner is just expecting a channel number, which naturally can't have
a decimal point in it, so it won't beep when pressed.

Wooh!!! The first dane in the group i've ever seen. :-)

Tell me what is the legal aspects of scanning in denmark. Roumors have told
me that it is ilegal but i am not shure if it's only the police transmissions
or scanning in general.

But ..... since i live in south sweden (scanning everything comletely legal)
close to denmark and radiowaves don't care about borders i can safely listen
in to the Copenhagen police. The 84 MHz suff semed to be a little oldish

with no tones, so instead the guy whistled to raise atention every time before calling a new unit. It was quit amusing to hear. (This was some years ago and the may have replaced the equipment and/or moved all operation to the 400 bands).

I'm planning a trip to Palm Springs and was wondering if anyone could provide me with freq.'s for police, fire, etc. or info on where to obtain them.

Also, being from Canada am I likely to encounter any problems at U.S. customs or Canadian customs taking my Pro-43 with me? Any one experienced any problems taking their scanner to U.S. or Canada?

Thanks,
Paul.

>Rich
I own an AOR AR1500 handheld scanner. It's a wide range monitor and covers .500
to 1300Mhz. Complete... nothing is blocked out. Including cellular. It's
funny, i picked up this monitor to pull in WEFAX signals, but it does do a lot more.
I had to make a funky antennea for the LW & SW Bands because a local AM
radio station is overmodulating and saturating the front emd. I only have a
problem when I'm listening to SW.. and this radio has a bfo!

I buily up a filter for the antennea... it works great. I even heard the
activity in Haiti .. and I'm in Massachusetts!

3119. NYPD Communications Question ?

Well, here I go again. A couple more minor changes made to this guide...
Berton Corson
Northridge, California

THE RADIO SPECTRUM

This is an approximate look, to help in searching frequencies on a scanner or shortwave radio. Just be aware, having the right frequency may not be enough, in tuning to a certain frequency. The time of day, atmospheric conditions, location, mode you're in (AM, SSB, Narrowband FM, Wideband FM, etc.), and your equipment, are also equally important. You'll find most transmissions are broadcasted in Narrow-band FM. Some main exceptions are shortwave (AM & SSB), commercial AM radio (AM), commercial FM radio (Wideband FM), television (Wideband FM), citizens band radio (AM & SSB), aeronautical communications (mostly AM), and some military VHF/UHF (Wideband FM). Most all scanners will pick a default mode for you, depending on what frequency band you are in. But many scanners also let you manually switch between modes (AM, FM, etc.) and frequency search spacing (5 khz, 12.5 khz, etc.) if the default modes are not correct. Happy Listening!!!

FREQUENCY USES/SERVICES
(in Megahertz unless
otherwise indicated)
---

10 - 150 khz Military/government, submarine
(.01 - .15 MHz) communications.

150 - 535 khz Longwave Band, beacons, foreign broadcasts,
(.15 - .535 MHz) maritime.

535 - 1700 khz Your standard AM radio dial.
(.535 - 1.7 MHz)

1.7 - 30 Shortwave/High Frequency Band. Broadcasting,
two-way government, military and commercial
communications, amateur radio, CB radio (approx.
27 MHz), others.
Shortwave - Approx. Range Meter Band
1.8 - 2.0 160*
2.3 - 2.495 120
3.2 - 3.4 90
3.5 - 4.0 80*

3.9 - 4.0 75
4.75 - 5.06 60
5.9 - 6.2 49
7.0 - 7.3 40*
7.1 - 7.35 41
9.4 - 9.9 31
10.1 - 10.15 30*
11.6 - 12.1 25
13.57 - 13.87 22
14.0 - 14.35 20*
15.1 - 15.8 19
18.068 - 18.168 17*
17.48 - 17.9 16
18.9 - 19.02 15
21.0 - 21.45 15*
21.45 - 21.75 13
24.89 - 24.99 12*
25.6 - 26.1 11
28.0 - 29.7 10*
(In general, the lower shortwave frequencies
<higher meter band> are received better during
the night, while higher frequencies are re-
ceived better during the day. There are also
some amateur radio bands between many of these
shortwave bands(*). Consult a shortwave guide
for more detailed information.)

30 - 50 Very High Frequency Band. Government, business,
walkie-talkies. Also, cordless phones and
'baby monitors' found about 46 - 49 MHz.

50 - 54 Amateur radio 6 meter band.

54 - 72 TV Channels 2-4.
Channel 2 Audio (Wideband FM) 59.75
Channel 3 Audio (Wideband FM) 65.75
Channel 4 Audio (Wideband FM) 71.75

72 - 76 Manufacturing, remote control, eavesdropping
bugs, etc.

76 - 88 TV Channels 5-6.
Channel 5 Audio (Wideband FM) 81.75
Channel 6 Audio (Wideband FM) 87.75

88 - 108 Your standard FM radio dial.

108 - 136 Aeronautical communications (AM).

136 - 138 Satellites.

138 - 144 Military communications.

144 - 148 Amateur radio 2 meter band.

148 - 150.8 Military use.

150.8 - 174 Business, highway, law enforcement, government, weather, maritime.

174 - 216 TV Channels 7-13.
Channel 7 Audio (Wideband FM) 179.75
Channel 8 Audio (Wideband FM) 185.75
Channel 9 Audio (Wideband FM) 191.75
Channel 10 Audio (Wideband FM) 197.75
Channel 11 Audio (Wideband FM) 203.75
Channel 12 Audio (Wideband FM) 209.75
Channel 13 Audio (Wideband FM) 215.75

216 - 220 Maritime and aeronautical.

220 - 222 Land mobile communications.

222 - 225 Amateur radio.

225 - 400 Military aviation and space.

400 - 406 Military and government.

406 - 420 U.S. Government.

420 - 450 Amateur radio.

450 - 470 Ultra High Frequency Band. Business, industry, military, fire, government.

470 - 512 TV Channels 14-20, shared with law enforcement.

512 - 824 TV Channels 21-69, others.

824 - 849 Cellular telephones (receivers/handsets).

849 - 851 Aeronautical telephones (ground-based towers).

851 - 866 Business, public safety, trunked systems.

866 - 869 Public safety, law enforcement, trunked systems.

869 - 894 Cellular telephones (towers).
Note: Even though listening to cellular telephone calls is technically illegal in the United States, one will usually do better listening to calls on the tower frequencies, as opposed to the handset frequencies. This is because most cellular phones transmit less than one-watt of output. So unless the cellular phone is very close to you, you will have much more luck scanning the more powerful towers, which transmit/receive for each cell site.

894 - 896 Aeronautical telephones (handsets).
Note: In scanning airplane telephones, you
will usually do better listening to the handset
frequencies, instead of the tower frequencies,
unless you are very near a ground transmitter.
But, in any event, call traffic heard on handset
frequencies (which are transmitted from a high-
powered transmitter on the aircraft) you may
hear nothing at all, or many conversations, de-
pending on your location and time of day.

896 - 901 Private land mobil units.

902 - 928 Land mobile, amateur radio, personal communi-
cation units, cordless telephones.

928 - 932 Radio paging.

935 - 940 Business radio.

941 - 944 Government and non-government fixed services.

944 - 952 Broadcasters' studio-to-transmitter links.

952 - 960 Private fixed services, paging.

960 - 1240 Aeronautical navigation.

1240 - 1300 Amateur radio.

1300 - 1350 Aeronautical navigation.

1350 - 1400 Radio location.

1400 - 1427 Radio astronomy.

1427 - 1429 Point-to-point, mobile, space.

1429 - 1660.5 Various satellite transmission uses.

1660.5 - 1668.4 Radio astronomy.

1668.4 - 1700 Meteorological aids.

1700 - 1850 Meteorological satellites, U.S. Government.

1850 - 1990 Fixed point-to-point, microwave.

1990 - 2110 Broadcast studio-to-transmitter links.

(end)

Tried that diode on D4. Didnt work. Well, the burglars got
my modified Pro-43 in August.. The nice insurance co.'s direct replacement
Pro-43 has an 'A' in the serial number. I wish to thank them....
<burp>

That Bearcat Sportscan is a double convertion unit, and you can pick up
the 2nd harmonic of cellular clear as day with no mods to it. Same thing
about the RS Pro- 2032, which I demonstrated to a surprised manager. I
used
a brand new 2032 right out of the box to tune in the 2nd harmonic of
cellular clear as day.
Triple Convertion units wont do this, though....

Source record: 267875

Several of the surburban police departments in Kansas City have apparently bought new GE trunked radio systems. They are running with 5 to 10 channels with channel changes with each transmission. This would not normally be any problem, but the GE system holds the carrier on for 4-5 seconds after each transmission, and sends a few beeps. According to a source, this is just for nuisance value as an anti-scanner feature, to keep listeners from hearing complete calls.

A company called LesComm apparently sells several devices, one called a Data Tone squelch, and another called GEScan and GEScanII. Has anyone experience with these devices? Do they work? Do they allow the scanner to resume scanning after the squelch tail from the voice transmission, bypassing these annoying tones?

Thanks to anyone that can give their experiences with these add-on devices.

IMHO Bob's posting was probably of general interest to most readers of the groups to which it was posted, and as such was within the usage guidelines for those groups. Furthermore, Bob is one of a very small handful of people whose postings to the "rec.radio" groups are of consistently high quality; check out his monthly scanner FAQ in "rec.radio.info" as an example.

If I may be so bold as to offer a bit of friendly advice, take care when flaming the folks who raise the S/N ratio in these groups lest you find the flamethrowers taking aim at you....

By the time you read this, I'll have added a database of all the
municipal frequencies (police, fire, ems) in California, sorted by town
name, to this page. Enjoy!

When I last flew thru Frankfurt and Dusseldorf (last year) with my
TH78, high-gain antenna, and related frobs, the security people nearly
had kittens. Thanks be that I was wearing a bright orange mountain
rescue t-shirt!

At the risk of sounding like an AOL basher, I ask, what SF frequencies
are you thinking of? The repeaters are in the ARRL directory (even tho
the SFARC 145.150 repeater seems to be dead these days), and everything
else is municipal (which is what I assume you meant by "public
service"). In case it's not true, here's the list for you to copy onto
a floppy, tape to a CD, or print and fold to look like a microfiche :-)

INSTRUCTIONS FOR RADIO SHACK PRO-43 CELLULAR RESTORATION
1. Remove the battery pack and cover.
2. Remove the four screws on back and GENTLY pry apart.
3. Remove the 6 silver screws from the 1st PC Board.
4. Remove solder from the ground pad and center feed conductor of the antenna directly under the antenna on the PC Board heat solder on top PC Board and center feed will loosen, this is the only really tricky part to this.
5. Disconnect the 2 plugs/wiring harness, make note of the color scheme for re-installing. Harness has 2-metal guides on the side....BE CAREFUL NOT TO PINCH WIRES.
6. Lift top board away from bottom, paying careful attention the black plug near the bottom of the assembly, gently pry this apart. DO NOT FORCE IT!
7. Remove 2-silver screws from the 2nd PC Board. (remember to replace on re-assembly)
8. Remove solder from the four points on the large silver shield covering the microprocessor board. Remove shield. Make sure to replace shield on re-assembly as this serves as protection from intermod and interference.
9. Near the bottom you will see a row of surface mount diodes (very small and square, approx 1/32" long, black with gray markings) These will be in locations marked D1, D2, D3, D4, D5. Some of the locations are blank.
10.Use a very low temp iron (15-watt) and the smallest solder wick available, remove the solder from both sides of D4. Use hemostats or needle nose (very small) to grip while de soldering. Remove diode D4.
11.Once D4 is removed you will have full 800 MHZ coverage and 30 KHZ spacing on cellular.
12.Save the diode you removed from the D4 position and install it in the D3 position being careful to make sure the diode is facing the same direction it was in the D4 position. This will increase the low band coverage from 30-50 to 30-88 Mhz.

13.Carefully re-assemble unit remembering to double check
before going on to next step.

USE THIS PROCEDURE AT YOUR OWN RISK!!!!

The 800 Mhz reception on the PRO-43 is superb.

When you've re-assembled the unit. Hit MANUAL, PROGRAM,
LIMIT, 870.00 ENTER, HIT LIMIT UNTIL "H" APPEARS AND THEN
890.00 ENTER. PUSH THE "UP" ARROW AND YOUR IN BUSINESS.
With this modification, this really is a great radio.
ENJOY!

IF the diodes dont seem to match, you may have gotten a "new" version of
the
43, so far RS has not changed the Radio to make it more difficult to
restore
dell freqs. Supposedly Radio Shack does not have to colmply with the new
law
till Feb. 94 (the law states that the radio "cannot be EASILY modified to
receive cellular) But they will still be able to sell the units made prior
to
the law...

Another "Better Mousetrap" file from the Temperance Society :)

3135. Pro-43 Mods-another textfile

Newsgroup: rec.radio.scanner

In article <36ke6m$os0@blackice.winternet.com>, fever@winternet.com (Fever) wrote:

> If anyone has any modifications for the Pro-43, I'd appreciate it if you could
> post or email them to me...This document describes how to perform three modifications to the stock PRO-43
Scanning Receiver. These mods will:

o Restore the base and mobile cellular bands in the 800 MHz range
o Restore the 54-88 MHz range
o Drastically reduce the volume of the PRO-43 beep sound

When you restore the cellular bands, the scanner will automatically search at the correct 30 KHz increments while in the cellular bands. The 54 to 88 MHz coverage is primarily used
for TV audio in the US (channels 2 through 6), but is used for police and other services in
parts of Europe.

Why delete the beep?
When you press the keys on the PRO-43, it responds with an audio beep to let you know
that the key has been "accepted" by the scanner. This kind of feedback is usually desired,
particularly since the keyboard of the PRO-43 doesn't provide tactile feedback. Then why
kill the beep? Because the beep volume is fixed on the PRO-43 (that is, it is not set
according to the volume control knob), and, at the same time, the volume is not equalized
between the speaker and the headphone jack. Because of this, while the beep volume is not a
problem with the speaker, when you listen to the scanner using headphones or through an
amplified system like your car stereo, the beep has the effect of a concussion grenade!

The mod reduces the beep volume from the speaker to a very soft level (you have to be in a
quiet room to hear it) and to the headphone jack to a comfortable level.

Some things to consider before killing the beep:

If you kill the beep, you won't get (from the speaker) the normal indication that the batteries are very low. In the case of the PRO-43, because it stores your channel frequencies in permanent EEPROM memory, you

won't lose anything if your batteries go dead. All that happens is you probably won't notice for a while that the scanner is not scanning anymore.

Another positive side of killing the beep is that when you use alkaline batteries, you may
have as much as three full hours of usage after the scanner thinks that the batteries are low. This mod keeps you from going batty listening to that beep for those three hours.

You do lose, however, the feedback the scanner gives you when you enter an incorrect entry.
Say you are going to program in the frequency 455.675. You enter in the 455 but don't hit
the decimal point properly. If you could hear the beep, you would notice it stop beeping
after pressing the second 5 (because it thinks you are entering a channel number that is
outside of its range). Without the beep, you have to rely entirely on the LCD display to tell that something is wrong. Not a big deal, but there are several kinds of operations that the PRO-43 helps you with that are similar to this one.

Performing the modifications:
You should have experience soldering and should feel comfortable working with very small
parts to perform these mods.

Tools:
You will need a small Philips screwdriver, a small slotted screwdriver, small needle-nose
pliers or tweezers, a low-wattage soldering iron, and a solder sucker or solder wick. A
magnifying lens of some sort (eyeglasses or lamp) and a high intensity lamp are highly
recommended!

All the references to positions assume that you have placed the PRO-43 with the keyboard
side down and the antenna at the top.

Procedure:
1) Remove the antenna and the battery pack. Then remove the 4 black Philips screws from
the back of the case. Put these and all other screws in a secure area.

2) Pull the back case off. The case will separate near the front of the scanner, revealing the stacked circuit boards inside. Place the scanner down on its face. You will encounter three circuit boards. The top board is the one you will see looking directly down. There is a second board in the middle, and the third board is the board that has the keyboard attached to it. The top and second board are connected together and will move as a unit.

3) Remove the six small screws from the top circuit board. Place these screws in a secure place.

4) The top and middle boards are connected at the bottom left by a small black 4-pin connector. Take your small, slotted screwdriver and use it to carefully pry up the black connector at the bottom of the top circuit board. A good place to pry up the board is above the metal shield on the left, bottom edge of the board. Once you lift up the top board by freeing this connector, you can shift the top board slightly to the left and right. First, shift the top board to the right so that the Philips screw on the lower left edge of the middle circuit board is exposed. Use your small Philips screwdriver to remove this screw. You may need to use your needle-nose pliers to grab this screw once it's loosened.

5) Shift the top board to the left so that the screw at the lower right edge of the middle board is visible. Use your small Philips screwdhave to angle the screwdriver slightly to get to the screw. The needle-nose pliers may also make it easier to remove the screw. l" over to the left. In order to lift up, you have to disconnect two connectors along the right edge of the middle board. Therese connectors loose.

(To delete the beep)
7) After you've folded the two boards to the left, look at the bottom of the second bond, you need to remove this resistor. Heat the connectors on each side and use the sucker or wick to remove the solder. Even afzers to pick it up. Try not to destroy it, since you can re-install it if you want to restore the beep. Tape this chip to the baner scans. They are covered by the metal RF shield. Desolder all four tabs that hold the RF shield in place. Use your screwdriveut it back the same way when you re-assemble the scanner.

9) After you remove the RF shield, locate the row of diodes. The labend 4 installed. Diodes 3 and 5 are not present. These diodes are extremely small so you will have to be very delicate in handliof the board. These are surface-mounted components, so the leads are not soldered into holes in the board but are attached dire ot be able to place the diode in D3 to restore 54-88 MHz.

(To enable 54-88 MHz)
11) If you were able to lift the diode off intiode matrix performs the following functions:

Diode 1, if removed, disables the keylock switch. If in place, enables the keylocables 54-88 MHz.

Diode 4, if removed enables the cellular bands. If in place, locks out the cellular bands.
Diode 5, if in placentation.

13) Take the top and middle circuit board unit and fold it back to the right, lining up the
pins for the right edge cls using your needle-nose pliers or tweezers.

15) Insert the black connector at the bottom of the top board, and replace the 6 rews in the top board.

16) Replace the back case, replace the 4 black screws, replace the battery pack and the
antenna.

To test the unit:
Enter the following key sequences:

PGM
LIMIT
870
ENTER
LIMIT
896
ENTER

Now press the up arrow. The scanner shoulase range. It will use the proper 30 KHz steps.

Now try:

PGM
LIMIT
54
ENTER
LIMIT
88
ENTER

Again press the up arrow. The scanily used for TV audio of channels 2 through 6 in the
US. TV audio is broadcast on wide-band FM (WFM). The PRO-43 only receives
ation:
There is much controversy about the 1986 ECPA legislation which made it illegal to
monitor cellular communications in tht against the law to modify your scanner to pick up these frequencies. It is just against the law to listen to them! Please use sts have
found that
making modifications such as these will not necessarily void your warranty. While it might
do so technicalyour mods in place!

Good luck with these modifications and drop me a note on CompuServe if you have any
questions or commentsmakes the PRO-43
tick
inside.

It was pretty commercial, although I doubt if his "day job", but an outgrowth of his hobby work. I also believe that Parnass has contributed MUCH more then his share to all of these groups, and it is an informative posting, so let it be. If all commercials were as informative and cogent, we'd not object to them, in general.

Hang on a sec. Using resistors with a meter is what you do to make the
meter *less* sensitive to the voltage coming in. What you described
effectively turns that 3 volt meter into a 9 volt meter.

Steve: You might try looking at meters that are rated at milli or micro
Amperes. See if you can find out how many volts it takes to make the
meter read full scale. If it is one volt, then you're set. If it takes
substantially less than one volt to read full scale, use James' idea.

If you do find something, lemme know what it's ratings are and I can tell
you what to use as far as resistors go.

Eric,
You may already know about it, but in case you don't know and are in the mood to build, take a look at the ARRL Handbook. It has a good section on DF'ing with projects. I'm not a ham, but I've found some useful stuff in that book.

I recently ordered and received three SCA demodulator boards from SCS Radio Technology after noticing an advertisement in Radio News. Bruce Elving's SCA design uses a CA3089 IF/detector chip and a PLL (I designed his XR2211 PLL SCA demodulator) SCA. Bruce also sells FM receivers modified with the boards.

What was interesting about the SCS SCA board design, while it uses a CA3089E IF chip also, a multipole filter in front of the 3089 decreases main channel crosstalk interference (by 60 dB). David's board is of excellent construction, with no jumpers and small size to be inserted in an FM receiver's FM detector stage (before deemphasis attenuates the SCA signals).

Anyway, three pretuned boards are available from SCS, 57Khz, 67Khz, and 92Khz - $20.00 each, $60 plus $6.00 P&H for all three. I am satisified with the design and construction of each board. One area of modification I would make is to monitor the SCA signal's multipath and level with an x-y monitor. Use pin 13 of the 3089 chip for a signal level (scope y) output and pin 7 for the y axis output. Of course levels must be set to set vertical and horizontal traces. A flat vertical line, max amplitude, is the ideal signal for tuning. A "wavy" line illustrates multipath. This is a great tool for tuning FM signals...

SCS's Address and Phone Number:

SCS Radio Technology
5742 Fairoak
Springfield, MO, 65810

Phone:

417-881-8401

He (Dave Jackway) takes checks only at present. While his focus is large-volume customers, he will sell to the small customer...

(I have no affilication with SCS, only as a satisfied customer)

For what it's worth, I remember seeing a posting requesting the balloon frequencies. The "Official Aeronautical Frequency Directory" sold by Radio Shack does not list a "balloon frequency" per se. However, I've heard what appears to be air to ground crew transmissions at 122.25 (AM). I haven't figured out if the transmissions I'm hearing are the local TV crew (KOAT channel 7, KRQE channel 12, or KOB - channel 4). Anyone in NM got the scoop?

Thanks,

Dave Comer

Hi Gary - I have attempted to use the body of my car as an antenna (which is what the no-antenna purports to do) and have some comments:
a. All Bob's little offering is a piece of coax with the center conductor connected to some part of the car body, with the shield left unconnected. You can do the same thing from parts probably found in your junk box.
b. If you are looking for a high performance antenna, and you don't live near a major city, maybe this would work - certainly it would work better than a duckie - HOWEVER....
1. I found that cross mod and intermod can really wreak havok with my radio (a AOR1000xlt) - there is simply too much signal for the radio to handle...
2. At best, this would be a compromise antenna - certainly it would work as a HF antenna (with an attenuator!) - receive only - but I have my doubts as a VHF/UHF antenna.
Here is my logic; based on my experiences as a ham, I know that polarization effects increase as the frequency does.
For example, a 2 meter horizontally polarized antenna can have several db difference when compared to a 2 meter vertically antenna working a SSB signal. I haven't tried it, but I would bet that as the frequency climbs, (say up to 80
(say up to 800 mhz or so, which is used a lot around here), that figure would grow. So polarization factors - around a body which is neither totally horizontal nor totally vertical - might be a consideration.

In short, I would create one out of parts from a junk box- that way, if it does create problems (such as intermod from overloading) you have lost nothing.....

73s and good luck Mike KA3JJZ

sternk@alumni.cs.colorado.edu (Kenneth Stern) wrote:
> What do I have here? Where should I be scanning?

A conventional (i.e. inexpensive) scanner converts the incoming signal to one or two stages of intermediate frequencies (I.F.), by mixing the signal with a local ocsillator (L.O.) and amplifying the difference between them. A usual I.F. is 10.7 MHz, so the receiver would tune its L.O. 10.7 MHz above or below the desired frequency. Since most scanners radiate this L.O. frequency, a second receiver can detect its presence.
For example: Assuming a scanner (the target) is tuned to 460.000 MHz. Its L.O. would be at 449.300 MHz (=460.000-10.700). A nearby second receiver (the hunter) would hear that L.O. radiation as an open carrier on 449.300 MHz. If the target were scanning through a range that included 460.000 MHz, then the hunter would hear a noise (the "chuffing" sound mentioned) everytime the target passed through 460.000 MHz.
Variables would include the actual I.F. used by the target (some receivers use 10.8 MHz, some use unconventional frequencies) and whether the L.O. is tuned above or below the received frequency. A receiver with a 10.8 MHz I.F. and a L.O. tuned above the intended signal would radiate at 470.8 MHz in the example.

The PRO-43 (and other triple conversion receivers) complicates matters by using different I.F.s and varying the 1st L.O. in steps, rather than continuously. This produces a 1st I.F. that is a band of frequencies, rather than a single discrete freq. like 10.7 MHz. The 2nd L.O. converts one freq. from this band to the second I.F.
This means that a more complex formula is needed to determine the target's 1st L.O. freq. (rather than simply adding or subtracting a fixed value). For a PRO-43 tuned to 460.000 MHz as the target, the formula:
1st L.O. freq. = 611.2 + 3.2 * int[RcvFrq/3.2]
produces:
611.2 + 3.2 * int[460/3.2]
= 611.2 + 3.2 * 143
= 1068.8 MHz
as the PRO-43's L.O. frequency. A hunter receiver tuned to 1068.8 would hear an open carrier (i.e. white noise or silence) [as would a VOR/TACCAN DME rcvr tuned to Ch 108Y, which is why the airline gets nervous when you bring your PRO-43 on board <g>].

For a cordless phone using Ch 8, the handset's receiver would be listening to 46.87 MHz. Assuming a 10.7 MHz I.F. and the L.O. below the received freq., the handset would radiate a L.O. signal at 36.17 MHz and would be detectable on any receiver within a few feet.
If a PRO-43 (the target) were trying to listen to the cordless base, it would be tuned to 46.87 MHz and _its_ L.O. would be at 611.2+3.2*int[46.87/3.2]

= 656.000 MHz. Your hunter would detect this as an open carrier. If the target were scanning through the cordless band, you'd hear the "chuffing" sound on the hunter (tuned to 656.000 MHz) each time the target hit 46.87 MHz. Unfortunately, the PRO-2006 doesn't receive 520-760 MHz, so a different hunter would be needed (something I realized when testing the examples <g>).

Class dismissed. Remember, there will be a quiz at the end of the week.

Below is a file I found regarding mods for the RS Pro 34:

Date: 4 Apr 89 14:24:01 GMT
Subject: PRO-34 Scanner Modifications

In the May 1989 edition of Popular Communications is a
"Letter to the Editor" on the Radio Shack PRO-34 Scanner. Below
is the text of that letter.

PRO-34 Scanner Modification

In regard to the information presented (March Issue) on the
handheld Radio Shack PRO-34 scanner, my own observations on the
modifications have been:

1. To restore missing 800 MHz frequencies, remove D-11.

Shown 41%, press <SPACE> for more, 'q' to quit, or 'h' for help

2. To add 66 to 88 MHz (European Coverage), install a diode at
D-9.

3. D-10 must remain in place for full 800 MHz coverage.

4. If a diode is added at D-13 it cuts out aero band, also seems
to affect 800 MHz channel spacing.

5. D-12 added dosen't seem to have any affect.

6. Only D-10 and D-11 are factory installed.

I wish to thank you for a fine and informative magazine. I
have had much reading enjoyment.

As you guessed, It is a little different with rs products.

First enter program mode.
Then enter frequency
Hit enter
Hit program again to move to the next channel.
or
Hit manual ch # and manual to move to the channel of your choice.

I have a 2004, 2006 and various bearcats and rs portables.

Go for it. Sounds like it is a winner and really broken in too !!

Mine has been running for at least 6 years 24 hours a day and it works
great (the backlight is dim and always was uselessly dim)

have fun. great catch

steve

The R-7100 freq coverage starts at 25 MHz. I read that the
latest versions omit 800 - 900 MHz, but I cannot verify this
as I bought mine a while ago.

I compared the R-7100 with the earlier R-7000 and posted this
summary:

COMPARING THE ICOM R7100 TO THE R7000 RECEIVER

by Bob Parnass, AJ9S

The radio RF/IF/AF portions of the R7100 are similar to the
older R7000, but the R7100 is constructed using surface
mount parts. Consequently, the R7100 is smaller. A-B tests
indicate both the R7100 and Radio Shack PRO-2006 receivers
are about equally sensitive, and more sensitive than the 6
year old R7000. Both the R7000 and R7100 are much more
immune to intermod than the Uniden/Bearcat 760XLT and the
portable PRO-43.

Many of the functions controlled by separate rotary switches
and potentiometers in the R7000 are controlled by pushbutton
switches and firmware in the R7100.

Deleted Tuning Meter, Added AFC

Too bad the R7000's analog center reading meter function was
replaced with 3 indicators on the R7100, a left arrow, a
square, and a right arrow. In my R7100, the square lights
if you are tuned within 2.5 kHz of center of an FM station,
a larger window for WBFM signals. The arrow indicates the
direction in which the tuning knob should turned to center
the receiver on the signal.

The R7100 has an interesting AFC circuit, controlled by a
front panel switch. The AFC will automagically tune the
receiver close to the center frequency if you tune near an
FM signal. You can watch the frequency change as the AFC

steps the receiver in 100 Hz increments (on NBFM). The AFC never quite tunes to the exact center, but tunes within a window set by a difference amplifier circuit, so the station sounds good even though the R7100 is slightly off center frequency.

Modes

R7000 and R7100 users have the same choice of modes, but they are easily selected from front panels controls in the new R7100. A rear mounted slide switch is used for USB/LSB selection in the R7000.

Fancy Firmware for Memory Organization and Scanning

The firmware in the R7100 is much more sophisticated, and a brief article wouldn't do it justice. There are 9 banks of 100 channels. Further, you can associate each channel with 1 of 10 groups. There are many possible ways to scan, more than listed here. You can scan:

all channels
all channels in a given bank
all channels in a given group
all channels in a given group in a given bank

all channels in a given emission mode
all channels in a given emission mode in a given bank

As with most other scanners, there is a lockout bit for each channel, so you don't have to scan the NOAA weather channel even though you have it in memory.

There are 10 pairs of search limits. The search and store ("memory write") scan mode lets you store 100 frequencies instead of the 20 in R7000. Another R7100 improvement is that you can program up to 100 channels for the R7100 to skip while searching. I used this for searching for federal stations in the 162-170 MHz range while skipping the NOAA weather channels 162.55, 162.4, and 162.475 MHz, as well as some veteran's hospital paging channels.

The R7100 has 2 VFOs, but Icom calls them windows. There are several window scan modes, but they resemble priority scan modes in a Bearcat scanner.

Both the R7000 and R7100 scan slowly compared with PRO-2004 and PRO-2006, and that's a drawback. Perhaps a bigger draw-back is that both the R7100 and R7000 employs a noisy relay, activated when the receiver is tuned to frequencies above 520 MHz. Scanning a mixture of VHF and UHF frequencies serenades the Icom user with a very annoying clickety-clack, clickety-clack!

New Memory Query Feature

The R7100, like the Bearcat 200xlt, has a feature which allows you to detect memory channels programmed with duplicate frequencies.

Tuning Step Selections

The R7000 tuning step size is selected using a rotary switch. The R7100 tuning step size is selected by using a pushbutton to step through the selections. The R7100 has more choices, including a 100 kHz step, useful for tuning around the aircraft bands.

Another new R7100 feature is that a tuning step size can be stored into each of the 900 memory channels, so when you use the tuning knob to tune off a memory channel, the R7100 tunes in reasonable increments (e.g., 12.5 kHz in the 450 MHz range, 10 kHz in the VHF-low band, etc.).

Rescan Delay Added, but Nondefeatable

Icom finally included a decent 2 second rescan delay in the R7100 which owners complained was missing from the R7000. Ironically, you cannot defeat the rescan delay in the R7100, so it's now more difficult to scan trunked systems in which the frequency changes with each new repeater transmission! Using the VSC voice squelch helps shorten the rescan delay unless scanning noisy stations.

Power Supply and More

The internal power supply in both radios runs hot. The R7100 comes with a 12 VDC power cord included, an option in the R7000.

The R7000 comes with a handy carrying handle and rubber feet, an $8.50 option on the R7100.

Added Clock and Timers

Unlike the R7000, the R7100 contains a digital clock and timers which can be used to turn the radio on and off, and tune to different channels, several times each day. I probably won't be using timers, though.

Which Radio to Buy

For fast, reliable scanning, you still can't beat a PRO-2006. If you want SSB reception, computer control, or a radio with a tuning knob and lots of features, I recommend the Icom radios.

The R7100 is more complicated to use than the R7000. There are so many firmware controlled features and there are several 2 key sequencies.

Faced with choosing between an R7000 or an R7100 in a simi-
lar price range, I prefer the newer R7100. Sensitivity
aside, both are about equal communications receivers, but
the R7100 is a better scanner, especially for finding new
frequencies and organizing memory.

Dave,

In practice, the losses would be high, especailly the higher the
frequency. Most of the commercial (Radio Shack) units would work nicely
though. I suggest using twin lead right up to the scanner and then the
adapter; twin lead has the lowest loss of all economically available
feed lines.

Andy

Does anyone know what Chip, Diode, or Reistor to pull in the pro-43 to release the locked out channels? It would be greatly appreciated....and what model or series can be modified?

Thanks..

3162. Mail order Catalogs???

That's 25mhz (it doesn't do shortwave or lower).

There are now two models of the 7100. One has cellular disabled and supposedly non-restorable (25mhz-799 and 900-2000mhz); the other has full-coverage and is available only to 'government agencies' (quoting Icom's ad in MT).

Ads in the mags I've seen suggest some mail-order dealers may still have old stock of the full coverage model made previous to the ban on their manufacture. I believe it's still legal to sell those, but it's limited to stock on hand.

You could try to pry one free from someone via the rec.radio.swap.

Actually, it's 25MHz-2000MHz (except for 800-900 if it's a newer unit)
^ ^
2000mHz would be, well, interesting?

We all know there is somepeople out there ready to rip people off, which unfortunately I was a victim of this foul play.
Now has anyone figured out how to take the risk out of people getting ripped off?

Eg. Someone has to assume all the risk, I send the money
then you send the product, now here is where the major flaw is, and where plenty of people have been ripped off.
Now what I was thinking off, does anyone know of a way to
overcome this problem? Maybe there is a firm out there that, is the middleperson, and waits for both parties to to come through with the goods and then, sends it through, finishing the transaction.
Now I know I would certainly like this method, of knowing that I will either receive my money back, or receive the product I purchases?

Now all you people out there what do you think????
I would rather spend an extra $10.00 dollars for the service say, than lose $200.00.

I'm finally able to get one of these gems, but am annoyed at the
"castration" of the coverage in US models. I've heard that a program is
being worked upon which (when downloaded(?)) will return the scanner to
its full coverage state as nature intended :^). On the other hand, I can
order it, say, from Javiation and get it in its pristine condition, but
would the scanner be using frequency layouts that differ from the States?
Any recommendations appreciated.

Thanks,

Tim

: image rejection. Could it have been a cordless phone?

Possibly not. Radio Shack has the habit of putting returned merchandise back
on the shelf, and reselling it as new. Maybe someone modified the radio, and
then returned it for some reason.

Couldn't one pop the EEPROM out and re-program it with the Forbidden
Frequencies, then put it back in? The scanner most likely prevents
entry of the frequencies only at the keypad.

>but I want one that has been proven to work.

>Joe

Frequency inversion system come in several flavors: good,
better,best, etc.

Good: means that high frequencies become low, low become high.
This is the stuff you can listen to with a ssb receiver.

Better: means that there are some small number of segments of audio
frequency which are swapped around. Units which have 16 different
segments which get moved around before transmission and moved back on
reception fall in this category. The 16 frequency band swapping is
decided before hand by both sides, and can be randomly chosen at call
setup.

Best: There are mass-production chipsets which have many different
segments, and are constantly changing the mapping of real frequency to
transmitted frequency range. This is tough to keep track of unless you
know the PN sequence for when the mapping is going to go to next.

Wonderful: There are chipsets designed for use in wireless phones which
actually digitize, modulate then transmit over the radio, where it is
demodulated into digital, passed through optional encryption, and then
Digital to Analog converted back to audio. This can be hard enough to
decode even if the digital data was not encrypted. If the data is
encrypted it becomes computationally infeasible in realtime for anyone if
a reasonable encryption scheme is used.

The basic question is what is the cost of the technology. As the systems get more secure they cost more. Really cheap 46/49Mhz phones (less than $150) are on the market which have the multisegment frequency inversion randomly chosen. This is beyond any SSB or ramsey kit decoding, since they can only do single (all audio is one segment) segment inversion.

Its really not as easy as people make is sound here.

Or couldn't one order a new cpu board from Tandy UK. The Pro-43 is made up
of 4 circuit boards that just plug together. Since the replacement board
is not itself a scanner (just a computer), there would be no legal violations.

Yup, that's pretty well what I found. I detected "scanners" in the homes of people I *KNOW* don't own one.

I had much better luck detecting "police" scanners. Unfortunately after discovering a few I found that searching for scanners at 0330h attracts police cars. Thanks for advice re: Motorola IFs, next time I'll listen for those too!

If you get the UK model and use the feature which automatically sets
frequency step and modulation, then a lot of the "guesses" will be wrong.
This is because the UK bandplan is different. It is probably possible to
correct this with software too, but there are no guarantees.

I just ignore the "auto" function and set the operating modes manually
just as on my other scanners, and it works fine.

Just use one of those TV 300/75ohm converters. You'll be close
enough to not make any significant difference (especially since
you are only worried about receiving). The 300 ohm
antenna is a balanced line feed and the 50 (or 75ohm TV) coax
is unbalanced. The balanced to unbalanced conversion is what
you need more than worrying about an exact 50 ohm match.

Most of the 300/75 ohm converters have the 300 ohm twinlead
side (screw type conection) and a TV 75 ohm coax F type connector
for the 75 ohm side. You can then just make up a cable with the
F type connector on one end and the (probably) BNC type connector
at the other end (or whatever type 50 ohm antenna jack your
scanner uses).

Cheers,

I heard from a bus driver that you can use a scanner as a way to find out if police are stopped on the road shooting radar. he explained that when a police car stops it automatoically turns on a beacon to let HQ know where they are, in case they get shot or something. To back up his theory, a truck stop that I was in had scanners for sale explaining that they could find police up to ten miles away. Any freq. info or general knowledge ?
Thanks

I believe that neither Illinois nor Wisconsin have any regulations about
using a scanner in your automobile... but Indiana does. Ask a lawyer if
you want LEGAL ADVICE.

Considering the steps involved in the original posting it would be conceivable for someone to program blank EEPROMS w/the forbidden frequencies and then install in an 'A' version of the Pro-43. A convenient method of programming would be needed. Perhaps first program the EEPROM in a host Pro-43, then use a commercial low cost EEPROM programmer to make copies. These copies could be installed in 'A' version Pro-43's. Start of a new business, anyone?

The one I just bought was shipped in from out of town and took several days and alot of waiting to get it. I'm glad I waited though.

Make sure, if it's important to you, that you check and see if they're new out of the box or floor models that had been sitting on the shelf with the power on everyday of their store life.

I don't mean this toward you specifically Rob Powell, it's just that I was told I'd get a new one and ended up with a floor model. I know the warranty still applies but I would've rather had a fresh one than been lied to by the RS guys at the store I purchased it from...

Well my friend forked out the cash and bought himself a 2006 and we were both extremely disappointed. First of all when you turn it on, a hissing sound comes from inside (very faint but noticeable). It sounds like the squelch isn't set right but this isn't the case. Also reception is almost nil. We were only using the supplied antenna that goes in the top and we weren't getting anything. I tried running my Pro-43 along side and it was picking up all kinds of stuff with the same frequencies we put into the 2006. We tried the two settings of the antenna switch but it still literally picked up nothing. I got it to pick up my cordless phone and a local radio station but thats about it. We couldn't even get local police. He's taking it back, but my question is, are they all like this? Should he exchange it or return it? Do they have to have an outdoor antenna to function at all? He's hoping to take it to work and he can't be using an outdoor antenna there. Hope someone can help us.

>the 400 bands).

You have been told correctly.
Here in Denmark it actually requires special permission to own
any receiver capable of receiving above 30 MHz except for amateur and
broadcast bands. There are no exceptions for licensed hams.

Note that it's not the act of listening that is illegal, it's the
posession of the equipment.

This means that you can't find any shops in Denmark carrying scanners and
accessories for them. Instead we have to go to Sweden for equipment.

The police are still using the 84 Mhz band for all car radios. The 447 Mhz
frequencies are used by portable units only.

Danish scanner entusiasts are possibly facing a boring future. The police
are now implementing a new country wide radio system based on digital
and encrypted communication. To my knowledge the system has only been
implemented in Aalborg (northern Jutland) yet.

>Below is a file I found regarding mods for the RS Pro 34:

I'm not sure who asked for these mods or why they were posted but I've seen a lot of folks do the 66-88 mod thinking it is going to work and they get very dissapointed when it doesn't AND they loose the 30-54 band.

Here is a mod file I constructed years ago.....

Pro34 Mods

Remove the four screws from the back of the unit, then remove the batteries. Gently remove the back cover from the unit. You will need to de-solder the antenna from the top board. Then remove the nuts holding the squelch and volume pots. There may be a wire at the other end of the top board to de-solder, which I think is mainly for grounding purposes. Then, there are four hex screws holding the top board on. Remove these and carefully wiggle the top board loose from the bottom. I say wiggle because there is a multi pin connector to unhook. Once unplugged, slide it out horizontally so that the volume and squelch pots slide out with the board. Then there are three screws to remove to lift the metal shielding from the bottom board. Once you have the bottom board in plain view, you should see D9, D10, D11 and D12 on one side of the board. Cut one lead of D11 and seperate the leads so they dont touch. This removes D11 from the circuit and adds the 800 mhz cellular phone bands to your scanner. It is a hassle to get to D11, but the added frequencies are worth it in my opinion. Of course, LISTENING TO CELLULAR PHONE CALLS IS ILLEGAL! There are other mods that do various things to the diodes but these mods are of little value. One, for instance, adds the 66-88 Mhz band but it also removes the 30-54 Mhz band at the same time. In addition, many units won't even pick up anything in the 66-88 band without major realignment. I know mine won't! There is one other mod that's worth doing. I can't remember the part designation, but there is a ceramic 2 Mhz crystal on the logic board (probably blue in color), near the main CPU You can replace it with a 3.4, 3.55 or similar value for increased scanning speed. If you go over 4 Mhz, your CPU *may* not be able to maintain its integrity. If you use a normal crystal, you'll have to bend the leads over and lay the crystal flat over a nearby chip. It will fit though and it works! Make sure the crystal leads and the crystal body are insulated from touching any other circuits. If you use the two second delay, it will be affected by the crystal. The delay time will be reduced by increasing the crystal frequency. When you put the unit back together, make sure the key lock switch is intact. Mine fell out and I

didn't notice it was missing until I had everything back together. Also, don't get the antenna connection too awful hot. There is a surface mount cap near the underside that will fall off if you apply too much heat. This is the input cap from the antenna. You'll notice decreased signal strength after you put it all together again. It can be a real bear trying to put surface mounted parts back on the board!! Trust me ;-)

Have fun. If you really screw up your radio, it's NOT MY FAULT !!!!!!

I'm wondering if anyone has attacked the major problem of the Pro 43:
That of intermod. My quick measurerments show it is about 40 dB
Even low end radios such as marine and ham are better than 60 dB.
Real radios like GE and Motorola commercial are better than 80dB.

Has anyone looked into improving the intermod performance? Even
a step up to "consumer quality' of 60 db would be vast
improvement.

Dear Mr. LaPierre and Ms. Metaksa

I appreciate having the opportunity to meet with you today to clear up whatever confusion may have arisen from a brochure bearing Radio Shack's logo which had not yet been authorized to be distributed to the public. This brochure was one of nine pieces of literature prepared for United Against Crime, a nationwide public/private campaign underwritten by Radio Shack to help Americans safeguard themselves against crime.

Unfortunately, and without the knowledge of Radio Shack senior management, the brochure contained a paragraph which could only be construed by some as an endorsement of gun control by our company. When the paragraph in question was brought to my attention, I ordered the entire supply of this brochure destroyed for two reasons:

First, it does not reflect Radio Shack policy. Radio Shack endorses responsible gun ownership for those who choose to own guns and gun owner safety and education, cornerstone principles of the NRA, to my understanding.

Second, and most important, we knew that any anti-gun language would be offensive to, and against the personal beliefs of, Congressman Jack Brooks, who, as all Texans know, is probably the NRA's staunchest ally in Congress in the battle against restrictive gun laws.

When we informed Congressman Brooks about the unauthorized brochure, he strongly agreed that it be destroyed forthwith. In accordance with his wishes, and because of our own company policy, we ordered the entire supply of brochures destroyed.

Any further distribution of this brochure is a direct violation of my personal order to all Radio Shack personnel to destroy it.

Thank you for allowing me to correctly state Radio Shack's position.

Sincerely,

Leonard H. Roberts

3199. Pro-2006 IF's

Newsgroup: rec.radio.scanner
Date: 1994-10-03 16:20:43 UTC
From: rbailey@nucleus.com
Message-ID: <Cx3uqK.Ewt@nucleus.com>
Source record: 267869

I just had some troubles with my pro-2005 and had to calculate and check all of the IF's. When tuned to 800.495Mhz (and below I think??) the first IF is 607.505Mhz (ie 1st VCO is 1.408Ghz), and when tuned to 800.500Mhz (and above) the 1st IF is 611.500Mhz (1st VC) is 1.412Ghz). The second IF is 48.500Mhz (2nd VCO's are 559.005Mhz and 563.000Mhz, respectively at frequencies above. This VCO 'steps' with the tuned frequency). The third IF is 455Khz for NFM and AM and 10.700Mhz for WFM.

BTW, the problem with my radio was a bad 48.045Mhz crystal on the 3rd mixer, made NFM and AM out by 10Khz but didn't change WFM.

Hope it helps.
Rob Bailey, WSC, Northern Telecom.

> still literally picked up nothing.

Ok, you are using the "whip" and have checked the position of the "ATT" switch on the back. Next I would make sure that you have the "MODE" set correctly, ie. use NFM for cops & cordless phones, WFM for FM radio stations and AM for aircraft comms. If you have somehow set the wrong mode you'll usually get zip.

Other than that, I'd say it's busted and to return it. BTW, the hissing is normal and a working 2006 is a joy. I find my 2006 more sensitive than my PRO-43 and more resistant to intermod as well.

The frequency used by the California Hiway Patrol extenders is 154.905 MHz.
Different states use different schemes.

Get a Yupiteru MVT-7100 from Canada. It covers 0.5-1650 MHZ with no gaps.
Quite reliable, very sensitive, 1000 channels, 30ch/sec scan speed,
supports AM, FM, WFM, USB, LSB. I've got mine for $CAN 740+7% tax.

The National Science Foundation is no loger in control of sections of the internet and as a result, there are no official rules against advertising on the net. The only thing regulating advertising now are the readers who get upset when they see ads. If the ad is directly related to the newsgroup and is presented in an informative, no-hype, manner, then I welcome this information.

My impression is that all things being equal (i.e., in the same location with supplied antennas), the 2006 should be a bit better than the 43. I'd try another before I gave up. The faint but noticeable hiss (mine is more of a hum with a hiss component) seems to be a characteristic of the unit. The quieter the listening room, the more noticeable the humm/hiss. If you listen for it in the store, you'll barely hear it due to background noise.

3213. A FAQ on Scanner Laws

Newsgroup: rec.radio.scanner
Date: 1994-10-03 19:12:33 UTC
From: davidm@iglou.com
Message-ID: <XU5akK7gXTrM072yn@iglou.com>
Source record: 267867
Cross-posted to: rec.radio.scanner,alt.radio.scanner

During the latest round of "can I listen to cellular phone" messages in rec.radio.scanner, I tried to find a FAQ on scanner laws. All I can find at rtfm.mit.edu is one paragraph about the ECPA in one FAQ devoted to scanners in general. Therefore, unless someone sends me email telling me where to find one thats already in existence, I'm going to start working on one.

And here, boys and girls, is where you good people come in. I know which states have state laws that govern scanners, and I know which federal laws govern scanners, so all that is pretty much covered. What I don't have is much information on which particular cities and/or counties have their own ordinances that govern scanners. If you know of a city or county that has their own ordinance, I'd appreciate it if you could let me know about it via email. If possible, send me the appropriate citation (for example, Kentucky's law is KRS 432.570), and if you could send me a copy of the actual law I'd be thrilled! But if all you can send is a message telling me "I know Podunk has a scanner law, but I don't know what it is!" well, that helps too. That atleast tells me where I need to look.

Oh yeah, I guess I should mention, initially I'm concentrating on the United States, but since a lot of people travel, I would be open to the idea of at some point expanding it to cover atleast Canada and Mexico, so if you've got some information for those countries, by all means, send it along!

I'm looking for a good reception antenna that can cover 6M, 2M, 70cm and 900MHz omnidirectionally. It seems like both the Diamond 130J discone and the AntennaCraft Scantenna would be suitable for this. Anyone have recommendations? I'm sure many other people would be interested in this also, since these two antennas seems to be fairly popular.

>With the DSCS III and IV birds up there... no.

Ever seen a commo grunt with a DSCS terminal on his back? I
didn't think so. Now, what about someone with a URC-110/112 or LST-5? I
hope so, since there are thousands of them in the inventory.

My point is that DSCS is nice for the strategic C3,I & NCA stuff,
but for conventional military tactical operations, the FLTSAT/LEASAT/et
al. stuff is used.

> >: 2) Is the typical mode FM, SSB, or what? > >
>Classified.

Methinks you're thinking along the lines of DSCS. The guy was
talking about FLTSAT.

The analog-voice modes are FM. Sometimes regular AM-mode
military aircraft comms are retransmitted, if they happen to be taking
place on what turns out to be a SATCOM uplink channel. Secure modes
are all pretty much digital these days. SOme of the newer UHF SATCOM
gear has integrated COMSEC ('ICOM') cypto gear, whereas the older
terminals (many are still in use) have separate KY-57/58s, SUNBURST
processors, etc. Many of the nets on UHF SATCOM use DAMA -- Demand
Assigned Multiple Access -- to increase spectrum efficiency. JCS has
required that the UHF SATCOM users (military & certain federal agencies)
have DAMA-compliant radios by OCT '96.

As for DSCS, in the past, Aviation Week & Space Technology,
SIGNAL, Army Communicator, Defense Electronics, Journal of Electronic
Defense, etc. have discussed DSCS, including a little info on the
modulation techniques. It basically uses a spread-spectrum, pseudorandom
scheme for all the voice, data, & video info. It is set up to be a
secure, somewhat survivable (this was deemphasized, to boost the MILSTAR
PR), anti-jam global C3,I network. Just going from memory, it uses the 7
& 24GHz ranges for the up & downlinks. Don't quote me on that, cuz I get
some of that stuff confused with MILSTAR...

I think Ramsey Electronics has a DTMF decoding kit for about $60. Most of these decoders use a crystal controlled single-chip DTMF decoder IC that provide a 4-bit output to decode 0-9, *, #, A, B, C, D. They are pretty easy to make if you can find the DTMF chip. Radio Shack carried one a couple years ago but they no longer have them. There's another company that advertises in some of the HAM radio type magazines that have a DTMF to serial port kit which allows you to decode DTMF and log the data to your PC. This kit sells for about $99.

I just got a pro43 about 1 hour ago from the RS at 9 Broadway in downtown
NYC. It's got a little tag on that says 1A4 and the serial number does
not contain an A. I'm assuming this is modifiable, but I don't know
anything about it really. The guy had to dig in the back for me to
find it. (I sure hope it is ok.)

There are a couple of other mods that produce similar results which can
be done without voiding the warranty (if you're concerned about it)

1. Stick an earphone adapter (a mono to stereo adapter available at RS
works fine) in the earphone jack without the head phones.
2. Take out the batteries and disconnect all power.

regards, r.w.

>1) Historical - aircraft have used AM from the beginning and changing
>over now would be a royal pain in the rear.

True

>2) Capture effect - with FM, the strongest signal wipes out all other
>signals, while with AM multiple signals can be heard on one frequency.
>This prevents a stuck transmitter on an aircraft from completely
>wiping out comms on that frequency, and ATC can recognize when two
>aircraft transmit simultaneoulsly.

Not quite but kinda true. The capture effect of FMn is pretty insignificant when compared to AM. It's not that hard to tell when two stations come up at the same time on an FM system. A significantly stronger station will capture FM or AM. Your first reason tells 90% of it.

>You can check this out with a scanner that switches from AM to FM in
>any frequency range (e.g. Pro-43). Select FM in the 118-136 band and
>you won't get squat.

True if you're using a GOOD FM receiver. Cheating with most scanners is easy since they don't have much, if any, limiting. The audio will be down a few dB but I can receive air traffic images with no trouble on my old PRO-thirtysomething - no "AM switch" required.

One of the things that happens when a CHP gets out of his/her car
is that a mobile extender is turned on. The mobile extender trans-
cieves the 42 Mhz freq of the car to a 158 Mhz freq of the handi-
talk used by the officer. The extenders are very low powered and thus
have short range...If you listen for activity on this extender freq.
you will be alerted to units close by...

3235. WANTED: Scanner

Newsgroup: rec.radio.scanner
Date: 1994-10-03 23:29:00 UTC
From: v064lnev@ubvms.cc.buffalo.edu
Message-ID: <Cx4EIu.4H5@acsu.buffalo.edu>
Source record: 267793

Hi folks,

I just a saw the new Uniden Bearcat 700A Scanner, and was impressed and
disappointed simultaneously.
I was impressed at the many features it had including: 12 band
coverage, 50 channel programmable, Super Turbo Scan (100 channels/second), LCD
display with back light (9 digit), 20 programmed private channels, police
channels (739 + 20 programmable), fire/emg channels (197 + 10 programmable),
air channels (1160), marine channels (90), weather channels (7), lockout
channels, band search, accessories (mobile mounting bracket, ac adaptor,
telescopic antenna, cigarette power cord and DC power cord).
But I was dissapointed that it didn't get these frequencies:

.01 - 29 MHz
72 - 76 MHz
216 - 406 MHz
800 - 806 MHz
1240 - 1300 MHz
1427 - 1429 MHz
1700 - 1850 MHz

I want to buy a mobile scanner for my car comparable to the 700A but
which will pick up these frequencies.
Any suggestions?

I read your post, and also picked a 2006 recently. Mine works perfectly, and far better than my other scanner (Pro 34). I think that you just happened to have gotten a bad one. Maybe the attenuator switch is stuck in the attenuate position internally regardless of the switch position. Either way, I would return it for an exchange. They do have a 30 day return policy. If you look around and make enough phone calls I am sure you will be able to find another. BTW the cell 968 to 896 mhz mod is the easiest mod to do on a scanner that I have ever done or seen done. I modded my pro34 and that was quite a job. I have modded about 14 pro 34's actually. I am selling my pro 34 to pay for the 2006 which I paid a little over 300 dollars. Ask for a 10% discount because it is a floor model and it is discontinued. See ya, ang gud luk

Get the RS All-band. Cheaper and better reception than the discone but ALOT larger- approx 12 feet diameter and 6 feet tall. Also make sure you get RG-6 coax, I was recommended RG-58 by the RS salesman- what a bunch of bull! I also have the RS 10 db inline VHF/FM/UHF bullet amp (cat #15-1117), covers 5-900 mhz range w/no skips- both the coax and the amp purchased on recommendation of a very knowledgable fellow scanner owner. Improved my range by 20 miles and my antenna's not even on a pole- only in the attic...

Take a look at the stats, the Pro-43 is actually a touch more
sensitive then the '2006. I've seen the same type of thing. I
also think part of it is a function of the squelch. The '06
seems to require a bigger signal kick to open the squelch then
the '43.

3254. Calif. Cellular Telephones: Price = Discounted Price + Rebate ???

Newsgroup: rec.radio.scanner
Date: 1994-10-04 09:24:04 UTC
From: merlin@neuro.usc.edu
Message-ID: <36r6vk$a6r@neuro.usc.edu>
Source record: 267814
Cross-posted to: alt.2600,rec.radio.scanner,misc.legal,la.general

I seem to recall a few years ago California passed a law requring vendors of cellular telephones to sell their phones to customers who do not want their phones activated for the advertised price + the rebate from the cell telephone company. I would like to acquire a Motorola Ultra Classic M to be used at a future date (probably next year when I can afford cell calls) -- but the local vendor (Affordable Portables) which advertised $69 price + $25 rebate (which should make the cost $94 total) insists in adding on extra fees for programming ($100 for a service they are not being asked to do -- and which I could do just as well on my own) and early termination ($275 for a service contract which I do not want to purchase). These fees would appear to violate the wording, intent, and spirit of the state law which was supposed to prevent this kind of consumer abuse.

Does anyone know how to find the state statute and/or who to contact for enforcement of the state law so I can buy my $94 Motorola Ultra Classic M cellular telephone without paying outrageous fees designed to prevent people like me from benefiting from the advertised price?

Thanks, Merlin

Subject: Programming Motorola cellular telephones (8000H & Ultra Classic)

Authors: Mark Earle mwearle@mcimail.com
Dave Rand dlr@daver.bungi.com

Normally as an end user, you must know the security code to get to programming mode. You may enter programming mode a total of three times. After three times, the phone must be returned to the dealer to have a counter reset. However, at least on the 8000H and Ultra Classic portables, one can fabricate a jumper, and reset the counter easily.

Before changing anything, I'd use * to step through and record your present values.

Note that if you install the jumper, you would enter 55# and then follow the notes for entering the customer/system information. You can also first do a 32# to clear all timers and restore features to standard. THIS ERASES ALL STORED PARAMATERS!

What I found most useful was to step through, record all paramaters entering programming mode from the keypad without the jumper.

Then, power up with the jumper, use 32# to clear evertying
power off

remove jumper
power up
reset params entering programming mode from keyboard,
using 000000 as the security code

This technique let me have two phone numbers in two markets, even
though the phone is single NAM. I'd get to a particular spot on the
road, with a convenient rest area, and reprogram my phone for service
(as contracted for!) in the second city. This was to have a local
number and not pay roaming rates in the second city. On the return
trip, I'd stop and reprogram for my "home" market.

Disclaimers: You can put the phone in several modes intended for
alignment and testing "on the bench". Don't do it. You could also set
the phone up such that the contracted for service won't work properly.
Don't program paramaters to other than those provided by your carrier.

There is no way (as far as I know) to alter the ESN on these phones.
Well, I'm sure it's possible if you're the vendor but there is no
magic keypad code to do it.

You can also make the phone a cellular receiver: power up with jumper

353# Select Handset audio path
08# RX Audio ON
11xxx# Three digit number, i.e. 11362#
474# Set to mid level audio
11xxx# Change to another channel

Power off, remove jumper, power up to restore normal phone
operations.

Dec 29, 1993 Motorola Cellular Mobile Telephone programming notes:

Part 1: From the manual included with the 8000H portable phone.

Items to be programmed:
System ID Code 5 digits
Cellular Telephone Number 10 digits
Station Class Code 2 digits
Access Overload Class 2 digits
Group ID Mark 2 digits
Security Code 6 digits
Unlock Code 3 digits
Initial Paging Channel 4 digits (Use Leading 0)
Option Bits 6 digits
*Internal Speaker 0 for internal
*Local Use normally 1
*Min Mark Normally 0, 0=disabled
when enabled, unit sends area code on all calls
*Auto REcall Always set to 1
*Second PHone number 0
*Diversity 0=off

Option Bits

Fabrication of jumper in lieu of test jig:

8000H and Ultra Classic
To enter diag/self test mode:

1.Remove battery.
2.Looking at rear of radio, ground pin x
3.Re install battery and apply power

Rear Connector:

I I I ** I I X
I I I ** I I I
**

* Is the antenna. I is the pins. Note: the case screws are NOT
at ground. The outer silver part of the antenna connector is.

I soldered a piece of stiff resistor lead at the X, and made it just
the proper length. I can then move it to touch the ground to read sig
strength, and then move it to touch nothing for normal operations.

Note that soldering to these pads is tricky, and probably voids the
warranty. A more elegant way would be to use a DC adaptor (Ora and

Celldyne sell them) and drill two small holes to use to connect with an external jumper. No soldering. Note that the phone is not in power save mode when in self test/diag mode and the battery will go down quickly!

The inital display is channel and receive sig strength indicator, useful for determing how close you are to a tower, or for aiming a yagi in the desired direction.

If you will ask about the police (or Highway Patrol or whatever) in a particular jurisdiction, I am sure that someone will be able to give you an answer as to whether that particular agency employs such a system. But asking whether "police" in general use this scheme is pretty pointless.

I will mention that I've seen no mention of special frequencies for this purpose in the numerous So. Cal.-area frequency lists that I've looked at. Of course I could have missed some.

I'm fairly certain that the California Highway Patrol is not equipped with such a system. In fact they don't even tell the base when they're making a traffic stop, and when they call in a plate or license number for an ID check, they don't say where they are.

Use of a "beacon" for this purpose seems unlikely in any case. There is a "panic button" system in use by some agencies; I believe the CHP uses them, or at least did so at one time: Among other things, it allows the officer to record a brief "where am I" message upon making a traffic stop; if the officer later pushes the panic button, or if the control transmitter (which is worn on the belt) is turned on its side, the message goes out, but until then it doesn't take up air time. And they use the regular CHP frequencies.

I've also heard references on the air to a "panic button" system in use by LAPD. (It was during a rainstorm and the silly things kept sending out false alarms.)

> To back up his theory, a truck stop that I
> was in had scanners for sale explaining that they could find police up to ten
> miles away.

Maybe in that particular area, a beacon system such as you describe was in use. Or maybe they were just talking about the scanners' ability to pick up regular police comms.

Or maybe whoever made the "find police up to ten miles away" claim simply made it up.

Sorry, but your question is simply too general to have an answer other than "maybe".

If you know what you need, and RS has it, and you don't mind the "last four digits of your phone number" routine, then they're ok. The thing to avoid is going into one and relying on the salezoids to give you the information you need to make a purchase.

I occasionaly buy something there on a weekend, when nothing else is open, or when I can't get it cheaper or easier elsewhere. I do a fair amount of hobby electronics shopping at ham flea markets, so I know what's available.

To be fair, some of their big-ticket items are pretty good stuff. For instance, the HTX202 2m transceiver is one of the better 2m handhelds you can get. I think I read it's made by Maxon under contract from RS?

I'd recommend a used ICOM R-100 mobile receiver. Covers 100Khz-1856Mhz
but 800-900Mhz is locked out permanently on new units. Price is $660 from
Grove but I've seen used units in excellent shape for $450-500.
Good luck.

Andy

Electroluminescent displays typically have a 500 hour life until
half-brilliance is reached. It will still work but only dimmer. I'd suggest
buying one or two spares for safety sake.

Cool. This is the only reason that I bought my scanner (a RS Pro-39)
was to find out where all the cops were hiding out around here. Read
something in a friends car audio mag about how useful a scanner was
on long trips, so I figured I'd try it out on my way back from
Florida to Ohio. So, what freqs should I be listening to here in
Ohio? Better yet, what lines from RS's Police Call should I program
in, so when I go from state to state I don't have to ask y'all again
:) Of course I also have a radar detector, but it feels awkward
driving down 75 a waving to the cop shooting laser, not even a
flicker of life from the laser light on my Escort. (Yea, I know why
and all, thats why I grabbed a scanner as a second line of defense :)

I have this one and another type similar to it. Neither one worked
very well. A little better on some freqs, a lot worse on others.
These amps are very noisy. They may amplify the signal just fine but
the noise is also amplified a lot, negating good results. Guess your
milage varied quite a bit! I'm not saying someone shouldn't go buy
one. Go ahead and experiment but don't get your hopes up too high!
Glad you're happy with yours. Maybe they aren't as bad as they were
when I bought mine several years ago.

3265. 2006/Optoscan/Scanstar Squelch problem

Newsgroup: rec.radio.scanner
Date: 1994-10-04 14:57:11 UTC
From: fa419@cleveland.Freenet.Edu
Message-ID: <36rqg7$ooe@usenet.INS.CWRU.Edu>
Source record: 267824

I've got the Pro-2006/Opto 456 combination controlled by a 286 and I'm evaluating the demo software 'Scanstar' that came with it. (*Not the crippled Scanstar program written for the Opto, but the demo*) It looks like it can do everything I need, but I'm having problems with (*apparently*) the squelch control.

I'm using the Ham 2m band (144-148 Mhz) for my test. The problem is that when I scan (under Scanstar) and it's logging the hits either to a log file or into a Scanstar group, it records the frequencies 5Khz to either side as hits as well. I should mention that I'm scanning in 5Khz steps and I have the choice of FM, FM-N, FM-W in the Scanstar software. FM was the default, I've tried FM-N with the same results. FM-W doesn't work right at all, though I wouldn't expect it to. I should also say that the 2006 works great on it's own. It stops right on the correct frequency, ignoring those 5Khz above and below. Also, I've noticed that there is a strong image (*completely readable*) of the center frequency (*using the term image loosely here, it IS the same signal*) 5Khz above and below. What I mean is that they are really there, but the 2006 can discriminate between them and the center frequency but Opto/Scanstar cannot.

Now, about Scanstar, there is an option when creating a new search range called Squelch Control Menu. Fine. Go into that and you have the option of Use Signal Strength (Y/N) and the settings of Max Signal Strength and Min Signal Strength. If I set Use Signal Strength to No, then the squelch control on the 2006 is in control but Scanstar will still log freqs on either side of the real signal as I said above. (*Note: if I turn the 2006 squelch knob all the way down, Scanstar logs every freq in 5Khz steps, just as I would expect it to, but I can't adjust it to log just the center frequencies.*) Ok, this method of squelch control SHOULD work in my opinion but doesn't, BUT: If I set Use Signal Strength to Yes, Scanstar detects and logs NOTHING... just sits there, apparently scanning but finding nothing at all. :(Although it's nice and peaceful now, it's not what I had in mind.
It
It's the RANGE settings you say! Nupe. With the Minimum Signal Strength set to -127 (Db below 1 millivolt) which is the minimum and Max Sig Strength set to 0 (max setting for it) (*By the way these are the Scanstar defaults as well*) I get nothing. This is a real mystery to me. If anyone can tell me what I'm missing here, I would really appreciate it because this is the last thing I need to complete my 2006/Opto/Scanstar package (*and I'd order the Scanstar software the same day*). Of course, I'm going to E-mail S. Dunham (Scanstar author) about my problem, but if this is something simple, maybe I can get a quicker answer from someone else with Scanstar experience.

TNX!

3268. BC200XLT problem

Newsgroup: rec.radio.scanner
Date: 1994-10-04 18:01:05 UTC
From: daiv@iglou.iglou.com
Message-ID: <1994Oct4.180105.23916@iglou.com>
Source record: 267727

I just bought a used BC200XLT and it seems to have a problem. It won't receive anything. All of the functions and keys seem to work right, but I can't even get noise by turning the squelch knob all the way up (or down, whatever. I've turned it both directions.). It appears to scan just fine, but it never stops. Not even on NOAA freqs that I know are active because the BC172XL sitting next to it picks them up. I've bought a new battery pack, charged it up for about 24 hours, and still nothing.

Other than the frequency resets (2,9,manual and 2,9,scan) which I've already tried, is there some other reset function or something that I can try before I search for somewhere that might be able to work on this thing?

Any clues?

I've been very interested in purchasing a scanner for a long time, and
I've recently been reading this newsgroup. I am fascinated by what you
can do with them, but I only have a vague idea of what their descriptions
mean. I see that Radio Shack is unpopular on here, but I'm looking for
suggestions on what to get for a beginner and where to go.
Is Radio Shack really that bad? there's one nearby and it would be pretty
convenient, but I need to know what to look for and what questions to ask.
Thanks in advance....

3273. SCANNER BAN/WIRETAP BILL

Newsgroup: rec.radio.scanner
Date: 1994-10-04 20:16:01 UTC
From: nitz@lds.loral.com
Message-ID: <1994Oct4.201601.18148@lds.loral.com>
Source record: 267729

The Digital Telephony bill (H.R. 4922/SB 2375)recently passed the Senate and House Judiciary commitee. It will soon go to the floor of the House and Senate for a vote. This bill could make a person a felon if he/she:

(6) knowingly and with intent to defraud uses, produces, traffics in, has control or custody of, or possesses_

(A) a scanning receiver; or

(B) hardware or software used for altering or modifying telecommunications instruments to obtain unauthorized access to telecommunications services,''.

Don't count on that "intent to defraud" as a defense. The way the legal system often works your ownership of such a device could be considered as evidence of intent to defraud. Congress could also quietly strike that clause from Title 18 of the U.S. code and we might not hear a thing about it.

Curiously the primary intent of this bill is summarized as follows:

BILL H. R. 4922
To amend title 18, United States Code, to make clear a telecommunications carrier`s duty to cooperate in the interception of communications for law enforcement purposes, and for other purposes.

Like most anti-liberty laws, this one is being sold on the premise that it is necessary for law-enforcement and drug interdiction. It is much easier to rally the people if there are witches to be burned. I don't currently own a scanner, but I believe this law would set an ugly precident. If you agree, by all means please call or write your senators and representative. Thank you.

I only speak for me...

>Neither one worked very well. A little better on some freqs, a lot worse
on
>others. These amps are very noisy. They may amplify the signal just
fine but
>the noise is also amplified a lot, negating good results.

I, too was told by some that the particular amp (RS #15-1117) I purchased would increase noise and it did but only a tiny bit. What I enjoy now is being able to pick up freqs I NEVER would've without it. The only real disadvantage I have is when a paging tower nearby goes off- I hear it in certain band ranges for a second. There are others out there that boast lower noise ratios but you won't find any for the $17.99 I paid. And, again, it improved my range over 20 miles.

>By the way, I forgot to mention that these work best if the bullet is
>installed at the antenna, NOT the end of the coax next to your receiver!
>Some folks moght not realize that.

The bullet amp I bought comes with two pieces- the inline bullet booster and the powered "receiver?"- the bullet must go at the antenna end and the powered "receiver?" must go at the scanner end for best results. Also RG-6, as I mentioned earlier, is the other key- changing coax drastically improved my receiving ability as well...

Source record: 267731

rbailey@nucleus.com (Rob Bailey) wrote:
> ... with my pro-2005 and had to calculate and check all of the IF's.

Actually, the 1st I.F. Alignment procedure uses the 800.500 MHz break as an arbitrary test point. The 1st local oscillator is incremented in 4 MHz steps, producing a 4 MHz wide 1st I.F. The second L.O. is then varied over a 4 MHz range to produce the 2nd I.F.

The various frequencies are:

Stage Loc Osc I.F.
1 636.000 - 1908.000 611.500 - 607.505
2 559.005 - 563.000 48.5
3 { 37.8 10.7 (WFM)
{ 48.045 455 kHz (AM/NFM)

The local oscillator freqs. are:

1st L.O. (VCO1/VCO2) = 612 + 4 * int[(RcvFreq-.5) / 4] MHz
2nd L.O. (VCO3) = (1st L.O.) - (RcvFreq) - 48.5 MHz

Now, let's get back to fast food freqs - I'm working on a formula to predict the frequency based on the second digit of the store's street address.

Message-ID: <36sh3j$5nn@hopper.acm.org>
Source record: 267732

Berton Corson> ... life span of the back-light on the RS-2006.
Reported experience has been 2 to 4 years, depending on usage, eyesight
and tolerance. It's amazing how much difference a new one makes.

Slow Bob> ... how hard is it to replace ...
Only two simple solder points, but a moderate amount of disassembly.
From memory: remove bottom & top (note speaker wires); disconnect front
panel (unplug / unscrew wires top & bottom); remove front panel; remove
logic board from front; unsolder two leads to the ELP; remove dab of glue;
slide ELP out of display assembly; insert new ELP; re-assemble.
Note that disconnecting CN3 (15 wire cable) pulls battery voltage from
the logic board and memory may be lost. Record all programmed channels before
starting or leave CN3 connected and try to work around it.

Slow Bob> ... Do you have to replace the whole lcd panel or what?
The ELP (electroluminescent panel) slides out of the sandwich that makes
up the LCD display. It can be ordered for $11.50 from:
Tandy National Parts (800) 442-2425

Give them the catalog nbr of the radio (20-145) and ask for:
Ref.No Mfr's Part No. Tandy Part No.
EL501 Electroluminescent GE-88D-7738 LB-0040

You might want to order the tech manual ($6-8) at the same time, if only for
the exploded view.

(C) 1994 Marc Grant May be redistributed only without charge.

(A budding electronic hobbyist walks into radio shack):

RSP: (Radio Shack Person): Hi. Can I help you?

BEH (Budding Electronic Hobbyist): Yes. I'm putting together a small project and need some parts.

RSP: Parts? We've got parts! Whatcha need?

BEH: Bailing wire, some plutonium, a shell with a three foot wide casing, a high current 6 volt battery, electronic timing circuit, and maybe a radio receiver and transmitter.

RSP: We have speaker wire, but no Bailing wire - would that be OK?

BEH: Sure, shouldn't make much difference.

RSP: Say - do you have a pair of speakers to go with that wire?

BEH: No, as a matter of fact I don't - but ...

RSP: Here - let me show you a set of Olyphonic 980s. Made with cobolt inserts and platinum lugs.

BEH: Cobalt - platinum - hey - let me see!

RSP: These babies are good from 0 to 20 MHz, and they even get single sideband!

BEH: Kewl. Well - put the speakers aside, I guess I'll take them. What about the three foot casing?

RSP: Three foot casing? What do you need that for?

BEH: We, er, are, er, making a small nuclear reactor for use with a detonation device?

RSP: Nuclear reactor? Please. Come look at our Mr. Science kits here - look - the Professional 9900 kit even includes its own impedence bridge!

BEH: Well, we were planning on the Brooklyn Bridge, but this here Impedence Bridge might be easier if it's small enough.

RSP: And let's see - you need a battery - here - let me give you one of these little cards.

BEH: Hey! This isn't a battery!

RSP: No - but when you come back each month you'll get a free battery each time you visit.

BEH: Well, this device is designed for a one time use. Look - I'm wasting time here - where's the timers?

RSP: Timers? What you need is a good home security system.

BEH: But I live in the desert, and there's no one around.

RSP: Here's the Mylanta 2000 - complete with a siren, auto alarm indicator, paging unit...

BEH: Paging unit - say - I could modify that - I'll take it!

RSP: WHat else was on your list?

BEH: Plutonium?

RSP: Sorry, you'll need to go to a drugstore for that, but we've got these really neat little spools of solder you could use - they melt at 20,000 degrees Kelvin, I think!

BEH: Hmmm. Made of Lead. I guess they'd be handy. I'll take 1000 rolls.

RSP: Sorry, I can only sell you 10 rolls, I don't know how to enter anything greater than a quantity of 10 into my point of sale terminal.

BEH: Sailing? You Sail?

RSP: Last four digits of your phone number, please?

3279. UTC-3000 Freq Counter for sale

Newsgroup: rec.radio.scanner
Date: 1994-10-04 21:47:46 UTC

Source record: 267733
Cross-posted to: rec.radio.shortwave,rec.radio.scanner

Optoelectronics Freq Counter model UTC-3000, with option package
BLB-30.

This handheld frequency counter covers 10Hz-3GHz, has a built-in
16-segment RF signal strength indicator, and in addition to displaying
direct & prescale frequency, will show signal period, ratio, time interval,
and average.

The optional BLB-30 package are internal options which provide for a
backlit LCD display, and also a 'beep' function which causes the UTC-3000 to
respond with a beep when it detects a signal.

The unit is in excellent condition, and comes with all packing
materials (original box & manual), leatherette case, ac adaptor, antenna,
and original purchase receipt.

$200

If interested, send e-mail.

I just purchased a Pro-43 scanner from Radio Shack and am VERY happy with it.
I don't think that the gripes against RS are so much aimed at the products
but more at the people who work there. I understand what it's like to work
in retail (I used to work at Best Buy and now at Comp USA) but many of the
people who I talk to at Radio Shack aren't as up on the products they sell
as I think they should be. Luckly enough, the RS next to me has some very
knowledgable people in it and that's where I do all my shopping. As far as
getting your first scanner, RS is as good as place as any. I'd ask here first
to see what everyones opinion is for a good starter s

whoops... incoming mail.. :)
anyway... see what everyone here suggests and then go to RS with piece of
mind about what you are buying just in case you happen to get stuck with
a bad salesman.

As with any large organization, there will be those believing they have not been completely served. From reading recent "scanner" postings it would be reasonable to assume the scanning community has a negative relationship with Radio Shack. I believe the assumption would be incorrect.

It has not been my wish, until this time, to become involved in this inane exchange. If you are new to Internet a few words of caution - if I may. Sift carefully. To it's credit, the ability to interact with fellow enthusiasts may afford you a wealth of valuable information - or it may not. I can not speak for others, but I would guess that the vast majority of those participating in the Internet radio groups have few, if any, Radio Shack gripes. The vocal few do not speak for the whole.

I congratulate you on your willingness to undertake research before purchase. As an informed buyer you have the power to be a fully satisfied customer.

NOTE: I have had a PRO-51 for a little over a month. The price/benefit ratio leaves me very satisfied.

To be fair, some of their big-ticket items are pretty good stuff. For instance,
> the HTX202 2m transceiver is one of the better 2m handhelds you can get. I
> think I read it's made by Maxon under contract from RS?

> -Tom R. N1OOQ randolph@est.enet.dec.com

Sort of agree. I also try to buy only sale items that I see in the
mail, on a circular they send me about once a month or so. Some of
their prices are high, but if you wait long enough, a lot of it
gets rotated to be on sale eventually..

In any case, this only alerts you to CHP units that are already occupied with traffic stops. The ones you need to worry about are the ones that are still on the prowl. In the old days the CHP used leave the mobile extenders on all the time, but no more.

> Thanks, Merlin

Merlin,

I KNOW EXACTLY WHAT YOU MEAN!

The name of the bill that you are refering too, that prevents
cellular retailers from bundling cellular service with an onerous
cellular plan (in California) is the Connelly Bill (AB 275).
Who I think you should contact is:

The Attorney General's Office
Telemarketing Unit
300 S. Spring Street, 5th Floor
Los Angeles, CA 90013

As far as 'Affordable Portables', I wouldn't touch them with
a ten-foot pole! Many cellular retailers try to skirt the law,
mainly by saying they sell to 'end-users' only, meaning they
want to program it, and want a cellular number from you to do
it, if they're not going to supply you with the service.
I had the same slop happen to me at Affordable Portables.
They told me a whole bunch a bull-sh*t why they can't just
sell you the phone and have to sell you some cellular phone
plan. What I heard from their salespeople was enough to
make me throw-up. They even told me they're not allowed to

sell phones because of 'cellular toll fraud'. It was absolute nonsense, as that isn't even their responsibility. I didn't pursue my problem legally with Affordable Portables, but Air Touch & L.A. Cellular told me they really can't do what they told me. Reputable dealers, like 'The Good Guys', will sell you outright every phone they got, if that's what you want. A Good Guys salemen even told me that Affordable Portables can't do what they're doing. In fact, he seemed angry at them when I told him what they did, since he has to go with Good Guy's company policy, which is to follow the law. He told me to sue them. I didn't, because I really don't have the time, or resources, to sue Affordable Portables about a $60 cellular phone. The problem is, that these retailers don't make much money (and maybe nothing) on selling the phones themselves, but on these one and two year cellular service plans. The law was supposed to put a stop to this unfare bundling, but it continues, as these retailers start fast-talking with their customers. Something really has got to be done about this...
Good Luck!

Yes. Here it is. Bought in July. It does have an A in the serial number.
Reason Im selling it? A friend of mine came across another scanner I would
like to purchase. So this scanner still has the original box,
instructions, and most if not all of the packaging. Would rather sell it
to someone local to the Bay Area, but I can negotiate a COD, if you'd rather.
Im asking $300. which is what I paid (less tax). Its in sellable condition..

Email me if interested..

I saw it printed in Monitoring Times Magazine!

The Canadian Imports are not "Censored"
I have an AOR AR1500 that has .5 to 1300Mhz no interruption!
anything over 1300Mhz all I need is a downconverter.
It's decent for monitoring utilities that's for sure.

>Jake
Jake, that's just a cell phone network doing it's thing! Don't forget cars are
mobile. It switches from cell to cell depending what location they are at. In
order to monitor a full conversation you need to find the data channel of that
cell and decode it. use the decoded information to switch frequencys.
It can be done. You need a PC, a cell capable scanner with a serial interface,
some programming knowledge, and a lot of patience!
I developed a cheap data demodulator for WEFAX, you can probably decode
the data with a high speed comparator circuit.

It will be a fun project, but you need patience.. first you need to crack the
data stream, they will be stupid if it's common 7bit or 8 bit ascii, it's got
to be encoded, but anything encoded can be cracked!

Well, finally got up enough nerve last night to try the cellular mod
on my Pro-43.

Everything went good until I actually saw the size of the diode I had
to remove---WOW are they ever small!!

With fingers crossed, I managed to remove the diode with no serious
side effects to the scanner (I won't mention the little accident
involving the soldiering iron and my pinky finger).

The moral of this story is - if -I- can do this (being
electronically challenged as I am), then anyone can - it's not really that
hard!!!!

p.s. Just listened to a couple of teenagers having a lovers quarrel about
who was sleeping with who last night. MAN, I love this hobby!!!!

>> Does anyone know how to find the state statute and/or who to contact for
>> enforcement of the state law so I can buy my $94 Motorola Ultra Classic
>> M cellular telephone without paying outrageous fees designed to prevent
>> people like me from benefiting from the advertised price?

Yesterday, Affordable portables quoted me:

$ 69.00 for the Motorola Ultra Classic M
$ 100.00 programming fee
$ 275.00 early contract termination fee

Today, Affordable Portables quoted me:

$ 69.00 for the Motorola Ultra Classic M
$ 100.00 programming fee

This is still $100.00 more than they advertised in the Sunday L A Times.
I don't want activation -- California State Law (Business & Professions
Code Section 17026.1(b) clearly states activation is not required:

(b) In each retail location, all retailers of cellular telephones
shall post a large conspicuous sign, in lettering no smaller than
36-point type, that states the following: "Activation of any cellular
telephone is not required and the advertised price of any cellular
telephone is not contingent upon activation, acceptance, or denial
of cellular service by any cellular provider."

The sales agent on the phone told me no cellular telephone could leave
the store without being programmed with a NAM as a matter of store policy
to cut down on cellular fraud. While this is a nice goal, requiring the
payment of a programming fee does not cut down on cellular fraud (that is
the purpose of the nonprogrammable ESN electronic serial number embedded
in each cellular telephone). Moreover, requiring programming of the NAM
is the same thing as requiring activation because there is no NAM which
could be programmed into the telephone without activation.

I want my $69.00 Motorola Ultra Classic M. I do not want it activated
with any carrier. I do not want it programmed with an illegal 'bogus'
telephone number. I do not want to pay extra for this illegal bundled
programming service fee which is being used to attempt to recover part
of the cost of selling these units below cost. The programming fee is
tantamount to requiring activation -- which is forbidden by state law.

>As far as 'Affordable Portables', I wouldn't touch them with
>a ten-foot pole! Many cellular retailers try to skirt the law,

>sell you the phone and have to sell you some cellular phone
>plan. What I heard from their salespeople was enough to
>make me throw-up. They even told me they're not allowed to
>sell phones because of 'cellular toll fraud'.

If someone wants to ban cellular fraud then they should forbid the manufacture of telephones with easily modifiable ESN's. There are even a few telephones (it is said the OKI 900 is one of these) one can actually decode and replace the resident firmware to create a device capable of capturing ESN's off the air and using those same ESN's automatically without any additional modification. There are also technical means (transmitter carrier wave fingerprinting and detecting calls originating from supposedly identical transmitters which are keyed up from locations too far apart to allow reasonable travel time).

To allow an entire string of retailers to violate state law by the imposition of a policy which effectively requires activation -- is entirely contrary to public policy (the legislature's attempt to forbid bundling of services with cellular telephone sales), amounts to an unfair trade practice/deceptive advertising, and is contrary to the best interest of the public.

I may end up having to complain about Affordable Portables to Calif Attorney General, District Attorney, City Attorney, Public Utilities Commission, California Department of Consumer Affairs -- but I know that the people who refuse to sell this cellular telephone for their advertised price of $69.00 are at risk of a misdemeanor fine of $100 to $1000 and/or six months in jail for each time they refuse to sell.

Opinions opinions. I agree that RS is a great place to get stuff when you
know what you want and I can do most of my shopping by looking thru their
catalog before I make a trip to the local store... very very convenient
and there are several stores in my area.

As for their HTX202 handheld (and other HAM handheld transceivers), I
personally think they feel cheap and cheezy as in cheap plastic with
poor fit 'n finish. They're rather large considering their very modest
list of bells and whistles. For the few extra bucks, I'd rather purchase
a quality Icom or Yaesu rice box. (I had heard that Icom makes some of
the RS HAM handhelds but if they do, they're not using their best technology).

3296. Pro-2006

Newsgroup: rec.radio.scanner
Date: 1994-10-05 04:28:06 UTC
From: robert1159@aol.com
Message-ID: <36ta0m$49q@newsbf01.news.aol.com>
Source record: 267757

I have had a Pro 2006 for several years and have always experienced interfearance on it. I cannot listen to any VHF frequency between 154.500 to 156.500. If I puch in any frequency in that range, it will come up as a birdie. There will be dead air and any singal that comes in will distored at most. IT does not work outside of this range.

When I first got the scanner from Grove. I thought it was defective, and tried out several other units from local Stores.. Same thing. IT is definitely a local signal that is interfering because I have taken the radio outside of Austin (TX) and it worked fine.

I was told that the local TV station - Ch 7. That it was their transmitter voice is causing my problems. the actual distance from me to the suspected tower is aobut 15 miles. Does anyone think one of those filters from Grove would solve this problem? Up until now.. I just use the radio to monitor other frequencies outside of this band. Are there any other persons in Austin Texas with a 2006 that can confirm this? I have put it in my car and driven all around and the signal fades at times but it's always there. But one you leave town .. it fades out.

Any help or suggestions would be appreciated.. I do have a 2004 that works perfect.. and have not tried a 2005 but I think a friend visited that had one and reported nothing unusual.. why the 2006??

Well, you could program the frequencies used by the individual cells used in your area. That would make following a cellular call easier. To do that completely, in a large area, would require over 600 channels.

Thanks for your informative posting. I wonder if you checked out the SCA
kit from Ramsey. They sell an SCA kit for $27.95 which continously "Tunes
entire SCA subcarrier band 50-100 KHz" Do you think there is an advantage
in using a pre-tuned board for 57Khz, 67Khz, and 92Khz rather than a kit
that tunes them all?

3301. Superior coaxial line?

A fairly simple question... I hope. I am on the verge of purchasing an RS all-band antenna for use with my BC200xlt scanner (this after deciding that constructing my own antenna might drive me insane) and now I am faced with the decision as to which type of coaxial cable to use. Basically, I will only be running a maximum of 10-14 feet of cable. I have seen a lot of RG-58 and RG-59, but have also heard that RG-6 is superior. Any (semi-) definitive answers out there?

Much appreciated...

Cheers, Dave

Call me stupid ;-), but why would one want to buy a phone now and then not use
it for a year. A year from now, that same phone will be even cheaper, and
probably better. Just my $.02 worth.

Regards, Vince

/I just bought a used BC200XLT and it seems to have a problem. It won't
/receive anything. All of the functions and keys seem to work right,
/but I can't even get noise by turning the squelch knob all the way up

That's funny mine did the same thing! (BearCat Quality???). I turned mine on one day after a month in the drawer. The display came on and everything seems to work except the receiver. I took it apart and noticed either a transistor or regulator on one of the boards was smoked. I expect the surge voltage did it? Anyway all the parts are surface mount and are hard to find so I sent it in for repair.

As soon as I get it fixed it's for sale!! I have had a pro-37 for years with no trouble. You would think it would be the other way around?

It's useful to have more than 200 channels and at least 10 banks in
a portable scanner for use in several locations. Due to the nature
of a portable scanner, it can be taken just about anywhere.

I arrange different sets of memory banks to correspond
to places I am when I listen. I have different sets of banks for:

- scanning while at home
- scanning while at work
- scanning while at shopping Mall #1
- scanning while at shopping Mall #2
- scanning while in town XYZ
...

In some cases, I need to scan more than 20 channels from a given
location, and that requires using more than one bank in the PRO-43.
Don't forget that (multi-channel) trunked systems eat memory channels, too.

I have a 2005 with 6400 channels. When I was in California, I managed to fill up about 2300 of them, but here in Utah, I don't think I'll make it to 400.

Here are a few ideas to fill more than 200 channels...
Having banks for Military air could take 100's of channels, add FBI, CIA, SS, DEA, FCC, FEMA, BLM, USFS, U.S. Marshalls, Federal Protective service, Marine, Cordless phones, Cellular, CB, Ham repeaters, MARS, Civil Air Patrol, Postal Service inspectors, Immigration, Border patrol, Customs, FAA, NTSB, ATF, Police (local, sheriff, SWAT, state troopers), Fire, Medical, local government, DOT, Aircraft, NASA, Tow trucks, Private security, GMRS, NOAA, TV, FM Broadcast, Cable companies, Utility companies, Malls, Sports, wireless mics, military bases...

You get the idea.

The $100 activation fee appears to be blantenly illegal to me. The "$25
rebate" may be a "waived activation fee." So you only realize that $25 if you
activate. That would make the effective cost of a $94 phone $69...but you
already know the math.

>> Does anyone know how to find the state statute and/or who to contact for
>> enforcement of the state law so I can buy my $94 Motorola Ultra Classic

> - scanning while at shopping Mall #2
> - scanning while in town XYZ
> ...
>
This discussion brings to mind a question. How do you organize
your channel banks? I tend to organize mine functionally rather
than geographically, with one exception:

1 - Police
2 - Fire, Rescue, Med Helicopters, Traffic Reports
3 - Local Aircraft frequencies & airports
4 - Trains
5 - Regional Air frequencies, ATC
6 - HAM repeaters, Space shuttle rebroadcast, etc.
7 - cordless phones
8 - Local emergency frequencies, unfortunately overlaid
by cellular images ;-)
9 - Same as 8
0 - Interesting frequencies near my parents' home, weather,
local TV audio (a lot of locked-out channels)

This is just how my own scheme evolved; one day I'll get energetic
and repartition it all. Any notion of what might be better?

Yes, but Congress seems to think they own the public. The bill goes to
the house floor for a vote TODAY (Oct 5.) Proponents are trying to slip
it in along with 40 other bills without debate. They also hope to pass it
in the Senate on a similar "unanimous approval" vote. This means that your
average congressperson won't even know what they voted for until it's too
late. It seems to be a common way of doing business lately.

I speak only for me...

I know the RS coax is supposed to be garbage, but you're right on that the RG-6 is better than everything except their RG-8. Check the coax loss chart on pg 110 of their 95 catalog. RG-6 is 4.4 dB/100' at 400 MHz and $0.22/ft, while RG-8 is 4.1 dB/100' at 400 MHz and $0.69/ft. It's a no-brainer.

: >definitive answers out there?

Answer for first poster: such a short run of coax really shouldn't matter
much what you use. Yes, RG-6 is lower loss than either of the other two,
but it really won't matter for this short a run. It will probably make
more difference how well you install connectors and how you position the
antenna.

: Someone told me that if I'm going to run cable over 30-40 feet, that I need
: to use RG-8 (.60 a foot). Any thing umder this I can use RG-58 (.20 a foot).

: I to am looking into this, I have two possiblities. 1) is over 100 feet on
: top of an dusk-to-dawn light pole. (owner of pole is me not elec. co.).
: 2) is on top of house about 50 feet. Is over 100 feet to far to run cable or
: is shorter the better?

Answers for second poster:
-- I think you are paying too much for your line. You can get RG-213 for
less than $.60/ft, and it's a bit better construction than RG-8.
Actually, RG-8 has been replaced with RG-213 in the "official" RG-list
as I understand it.
-- What line you choose depends on what attenuation you are comfortable
with, how much power you will put through the line, and how long you
want the line to last. The attnuation is frequency dependent, very
close to

dB/100ft = k*sqrt(freq),

where the k depends on the line. Roughly, if freq is in MHz,

line k
RG-58 .55
RG-213 .23
RG-6 .3
7/8" Heliax .045

Lines using foam dielectric, or partially air dielectric (like Belden
9913) have a larger center conductor than lines with solid dielectric,

and therefore have lower attenuation--I'd guess the k for 9913 must be around .17, but don't have the numbers handy. Also, there's "RG-8X" which is a little larger than RG-58 but substantially less attenuation, between 58 and 213.

Shorter is always better in terms of attenuation, but longer may more than make up for it with more effective antenna gain. But ultimately you will loose with a long enough line. You have a better chance of getting a signal through to a station 1000 miles away on HF with antennas than running even the largest piece of coax you'd care to consider. 1000 watts at .1dB/100ft is still over 5dB/mile is 5000dB/1000 miles... Remember, each 3dB is a loss of 1/2 your power. The answer for your situation depends on the frequency of operation and the type of antenna and coax you will install.

>
Try Belden 9913... I really don't get too hung up on 52ohm vs 75ohm. As
most cable impedence is quite varible through out its run. Just look at
the cable specs. and line loss figures and compare RG-6, Belden cables
and RG-8/RG-58 I use the 75ohm stuff (it has 100% shielding and very low
loss). The impedence really matters more if you are transmitting, not
recieving. Drop by an electronics supplier (not RS) and get or look at
their Belden spec sheet.

> that tunes them all?

The kit may tune that range, but the input filter doesn't. It is fixed and
the other freqs are something like 40db down. I think it is centered at 67Khz,
but it is been awhile. I built the kit and I analyzed the filter with spice.

3326. DDI/D & Pro2006 package for sale

Newsgroup: rec.radio.scanner
Date: 1994-10-05 19:52:28 UTC
From: rbn@apple.com
Message-ID: <36v05s$s40@apple.com>
Source record: 267650
Cross-posted to: rec.radio.scanner,alt.radio.scanner,rec.radio.swap

Why? Because I simply don't use the DDI/D, and the Pro2006 has the interface to the DDI/D built in.

If you don't know what the DDI/D is, you probably don't want it.

I'm looking for the best offer over $800 for the package. Hardware, software, cables...everything you need.

For a local buyer and an additional $200, I'll throw in a 286 configured to run the above. (I won't ship the computer.)

I wrote to my local representative last month about the FBI wiretap bill. I concentrated my letter onthe portion relating to scanners. From the reply I got, it seems I should have taken the whole bill and express my opposition to the whole. I'm considering replying to his reply with my new found knowledge of the rest of the bill.

Attached is the reply I received from Mr. Levin. Some of you may care to hear it from the horse's mouth. Comments are welcome. They might help me in formulating a reply. I can also post my original letter to Mr. Levin if the need arises.

My comments are in brackets.

September 20, 1994

Mr. Gregory Corteville
XXXX XXXXXXXX
Troy, MI 48098

Dear Mr. Corteville:

Thank you for writing me in opposition to H.R. 4922, to amend title 18 of the United States Code. I appreciate hearing your views on this subject.

I understand your concern in this matter. The purpose of this legislation is _not_ to ban radio scanners for use by hobbyists or make it unlawful to use your radio scanner to listen to the various public service bands. What the legislation does do is to clarify and expand

the already existing law making it illegal to use or own a radio scanner for the express purpose of _committing a crime or fraudulent act_. The reason for the clarification is that some criminals use the scanners to listen to private cellular phone conversations to get an individual's phone id number. They can then use this number to make phone calls to anywhere around the globe at the original owner's expense or sell this information to others to use for this purpose.

H.R. 4922 would also extend the privacy protection status given to cellular and hard wired phone to cordless phones. Current law already prohibits listening in on private telephone conversations whether they are made on a cellular phone line or a hard wired phone line. Cordless phones were exempted from the existing law due to their previous inability to totally differentiate their signal from other cordless phone units. The phone industry has in recent years made improvements to cordless phones to them [this typo was in the letter I received, its not mine.] function more properly and cut down on the frequency of this occurence.

The legislation is currently awaiting consideration by the full House Committee on the Judiciary. While I am not a member of the Committee, I will keep your views in mind when the bill comes up for consideration by the full House.

Again, thank you for writing. I hope you will continue to do so on issues of concern.

Sincerely,

(Signature)
Sander Levin
Member of Congress

Yes! Out the window! Here's how

Along the ledge, place some sponge/foam rubber.
Then, run your cable(s)
Place matching foam on top.
This will insulate the open window.
Close the window, without mashing the cable but close it tight.
Then, you can get a stick, to place in the space between the slightly open window and the top window frame. This allows you to "lock" the otherwise open window.

Be seeing you,
No. 6

No one is 100% sure. The 'truth', however, is that it's modifiable if and only
if there is no A in the serial number, i.e. A in serial number=not modifiable
no A = modifiable

No exceptions to this rule have been reported to the net.

I have a question reguarding a motorola cellular phone.
I want to rewire up a new 25 pin connector...
the existing pins that are in use are as follows...
pin 16 + power
pin 3 - power
pins 14 and 15 hands free mic
pins 2 and 20 are jumped together

to put into test mode (nuts and volts say) jump pins 20 and 21

my question is:
When i jump pins 20 and 21 do i leave the wire that going from pin 2 to 20
there? if so i will have 2 wires soldered to pin 20.

If anyone has the answer to my question please respond..

Message-ID: <Cx81Lv.9zp@lazrus.cca.rockwell.com>
Source record: 267649

I heard from my local Radio Shack helpful salesperson that the 'SILENT PLAY' device may be coming back. I was asking about something for a CD to tape player, and he described an FM transmitter that showed up "NEW" in his computer about 3 weeks ago. His description sounded a lot like the descriptions of SILENT PLAY video game device that was discontinued.

He expects some to show up in a week or two.

Perhaps SILENT PLAY lives... :-)

Berton Corson (g9153402@huey.csun.edu) wrote:

: As far as 'Affordable Portables', I wouldn't touch them with
: a ten-foot pole! Many cellular retailers try to skirt the law,
: mainly by saying they sell to 'end-users' only, meaning they
: want to program it, and want a cellular number from you to do
: it, if they're not going to supply you with the service.

I was a dealer for these phones at a local retailer in LA that was
similar to Affordable Portables...

: I had the same slop happen to me at Affordable Portables.
: They told me a whole bunch a bull-sh*t why they can't just
: sell you the phone and have to sell you some cellular phone
: plan. What I heard from their salespeople was enough to
: make me throw-up. They even told me they're not allowed to
: sell phones because of 'cellular toll fraud'. It was absolute
: nonsense, as that isn't even their responsibility. I didn't
: pursue my problem legally with Affordable Portables, but
: Air Touch & L.A. Cellular told me they really can't do what
: they told me. Reputable dealers, like 'The Good Guys', will
: sell you outright every phone they got, if that's what you
: want. A Good Guys salemen even told me that Affordable

What I was told by the management that we were permitted to sell
telephones to customers that ONLY needed a phone hook-up as well. It
seems that it is common practice for the retailers to mark the phones
down below cost to remain competitive in the LA cellular phone market.
These retailers also hope to make the hefty profit for signing up the
customers as well. The last time I heard what the commissions to a
retailer were was about $250-270 for the regular service and $150 or so
for the 'Night" discount service. Recently (about a year ago when I was
working there) the cellular companies decided they want to do a flat
rate for service up to X minutes... and that lead to even more bizarre
commission practices. We were told flat out never to admit we had the
phones in stock until we were absolutely sure the customer did not
already own a telephone. Otherwise, the phones weren't in stock. I was
screwed as well, since if I DID sell a phone without a number, I recieved
no commission at all.

: Portables can't do what they're doing. In fact, he seemed
: angry at them when I told him what they did, since he has
: to go with Good Guy's company policy, which is to follow the
: law. He told me to sue them. I didn't, because I really
: don't have the time, or resources, to sue Affordable Portables

: about a $60 cellular phone. The problem is, that these
: retailers don't make much money (and maybe nothing) on selling
: the phones themselves, but on these one and two year cellular
: service plans. The law was supposed to put a stop to this
: unfare bundling, but it continues, as these retailers start
: fast-talking with their customers. Something really has got
: to be done about this...
: Good Luck!

: Berton Corson

I was able to get me a Panasonic HP-type cellular for $140 at Good Guys a year and a half ago. My company advertised them for $179 (in stock only if you need a #) I called good guys and found out they were in stock... for $479 after beating the price, I got the phone w/o a number. Went to a local dealer I knew & he hooked it up for me with a $150 kickback for the business, plus a case, car charger, and antenna.

Other interesting facts about cellular commissions:

Commission rates are higher if you hook the customer up on a flat-rate plan (use it or lose it plan).

If the customer disconnects within 6 months, the carrier will retroactively bill the retailer for the commission. My retailer also retroactively took back the commission on the phone sale as well.

Adray's, another local dealer sells phones, but they are all pre-programmed. They just call up the carrier and activate the number. If you already have a number, there are no "unprogrammed phones to sell." Therefore you need to pay a "deprogramming fee" of about $100-150 for the telephone. Shit, I can program a Motorola, OKI, or Panasonic in about 30-45 seconds. I'd love a job programming phones for $1600+ bucks an hour.

BTW the retailer I worked for was LA Tronics.

Tanuki

: If the frequencies are in discrete eeprom. I suspect the chance would be in
: rom on the CPU chip.

Oops. Lesse if I can explain this better... Let's say a scanner and program a few of the cell phone frequencies into it's memory. Then, I take the memory chip out and place it in the same model scanner that can't recieve (let you receive might be a better word) the frequencies already saved in the memory. The scanner will read the frequencies from the memory and use them without checking to see if they are valid or not. Note that the memory device could be a RAM chip (in this case use a Dallas NOVRAM) or an EEPROM. If the scanner has an external ROM, someone could program a software patch for it that would re-enable the frequencies locked out.

> I was told that the local TV station - Ch 7.

TV Ch 7 will not cause any problem for a PRO-2006. For dual-conversion receivers with a 10.7 MHz I.F., Ch 7 would produce images in the range 152.6-158.6 MHz (audio image at 158.35), but the 2006 uses triple conversion and a completely different I.F. layout.

However, the conversion scheme in the 2006 could produce an image from well out of the normal bands. Assuming the internal frequencies are the same as in the 2005, tuning the range 154.5-156.5 could produce images from the range 1371.5 - 1373.5. If this is the case, then there should be a sharp drop in the problem at 156.5, where the rcvr's local oscillator increments a 4 MHz step.

The band 1350-1400 MHz is allocated primarily to U.S. Govt Military Radiolocation, i.e. radar, with secondary use in radio astronomy. The questions to be asked are: Is there a noticable decrease in the problem at and above 156.5; Is the effect centered on Austin itself, or perhaps on Bergstrom AFB; Is there a major (fairly modern) radar installation in the area ?

I drilled a hole in the aluminum frame. It was dark colored aluminum,
so it should be easy to put some dark putty to cover it when it's
removed.

[longish .sig deleted]

I used to think the same way until I started programming my '43. In my area, there's public service frequencies for the university, city, county, and state. I also live 40 miles from El Paso, Tx., so there's public service for that city, county, and state. Then there's White Sands Missile Range and Holloman AFB nearby. Also, since we're so close to the border, there's DEA and Border Patrol frequencies. Don't forget El Paso Intl. Airport, too. Then, of course, there's all the 'other' local frequencies to listen to. Having the itinerant and low-power business freqs, as well as the ten cordless base frequencies, programmed is handy. Needless to say, I don't have any room left for AT&SF operations, travel frequencies, or anything else.

If I had the equipment, I'd do this mod, but doing the cell mod with a regular 30-watt iron was harrowing enough for me, thank you.

My cable TV system (Cablevision, West San Fernando Valley, CA) advertises DMX Digital Music Express, offering something like 60 channels of continuous music using what I think is another decoder to connect to the stereo, which works with a DMX remote control.
Does anyone know if it is possible to listen to this stuff on my RS-2006 scanner (in mono of course)? What frequencies would they be sitting at? Would a coax to BNC converter just do, to lead the cable system's signal into the scanner? I'm wondering if the whole thing is digital, being transmitted through the cable system, which would make listening this way impossible.

>This is just how my own scheme evolved; one day I'll get energetic
>and repartition it all. Any notion of what might be better?

Maybe not better, but here's my 'mobile scheme' for a Pro2026, 100 ch:

1. Local 'top 20' police, fire, med, and a couple of utility
companies. (My work has me on standby a few weeks a year,
so the utility companies are necessay)

2. Snoops Band. Cordless, Marine ops, old mobile phones

3. Expanded fire selection. More fireground channels, air
attack, search & rescue

4. More utility companies, a few interesting business channels,
some ham repeaters

5. Out of town run channels. Neighboring law enforcement,
highway patrol.

The list greatly expands when I have 400 channels at my disposal at
home, with repeated channels for 'selective scanning' by bank. It's
nice to be able to punch up the bank for a marine rescue, and have
just the needed agencies in one bank, without getting interrupted by
the meter maids.

In a receive-only application like scanners, and if your talking a length of 30-40 feet, I'd suggest RG-6 over RG-8. Its cheaper, it has less loss, and its easier to work with since its diameter is thiner. RG-58 is *GARBAGE* for anything over 10-15 feet if what you're shooting for is higher than 30 Mhz or so. By the time you get up into UHF, you've lost 75% of your signal in the coax. Save yourself some heartburn and skip it.

> is shorter the better?

No, 100 feet isn't too far, however, personally I would suggest that you also look at installing some kind of pre-amp at the antenna, or else start looking at coaxes like 8214 or 9913.

ks> BTW, does anyone know what the mod is for the Uniden BC 2500XLT/B is?
ks> I just ordered one from Damark, and heard it can be modified, but I
ks> have not seen the post about it.

I don't know if the unit can be modified. Only OCIC and OLIC are the
datecode of the units that can be modified for sure. If you have one of
these codes...

Product...Uniden Bearcat 2500XLT Datecodes OCIC and OLIC
Purpose...Restore full 800 Mhz coverage
w/ 30 khz stepping when required.

** Disclaimer...Modifications are done at your own risk. This product uses
surface mount components which make performing this mod difficult. If you
are not comfortable with surface mount components, DON'T DO IT. This
modification will void your warranty.

** Legal stuff...Performing this mod may enable reception of certain
portions of the 800 Mhz band that is forbidden by U.S. federal law.

This modification is from the Sept. 1993 issue of Monitoring Times, p.94

1. Remove the antenna and battery pack from the unit. Lay it on the face
on a soft cloth or towel, bottom of the radio facing you.

2. Carefully pry the back loose from the radio and lift it off.
Similarly, grasp the visible circuit board by the edges and carefully pull
it away form the radio just far enough to separate it from the white (11
pin) Molex connector. Do not stretch the remaining ribbon connector. Lay
the board alongside the radio.

3. Locate microprocessor chip "Uniden UC-1513A" and the cluster of chip
resistors marked "104" below it. Using a magnifier and fine point
soldering iron, unsolder the lower-left-most chip resistor and move it one
place to the left, soldering it in place.

Re-assemble unit.

MM> Radio Manager v2.01. It say's it will work with a 2006, what kind of
MM> connection will I have to get or make?

Hi, Mike...This is the only info I have for the program. Ben Saladino is
the author of this text and the shareware program Radio Manager 2.01. It
is available at the BBS listed on the tagline as well as CompuServe Hamnet.

Radio Manager for Windows 2.01 9/14/94

Radio Manager for Windows is a radio control program for the Icom R-7000
Radio. It should also work with other Icom radios. New version 2.0 works
with the OptoScan456(tm) from OptoElectronics. Radio Manager handles
scanning, delays, 5 priority channels, lock-outs, presets, search ranges and
more. You can choose your own delay amounts and priority checking intervals.
Radio Manager stores data in Bank Files that can have 999 banks each.
Within a bank you can have 999 channels. That's 998001 channels! Your
computer's memory may limit this. You choose your own channel and bank
numbers. Each bank can have a description, and be enabled or locked out.
Radio Manager comes with Frequency Manager (see FM.TXT), so you can
organize your frequency list. Radio Manager can then extract information
from Frequency Manager files when needed.

System Requirements:
* 80386 and higher IBM PC and Compatibles with 4MB RAM
* Windows 3.1 or Higher (running in Standard or Enhanced Mode)
* SHARE.EXE must be loaded for Radio Manager to function properly
* A hard disk with 2MB free disk space
* A 3.5" or 5.25" floppy drive
* An available Com Port and a Computer-Radio Interface that supports
signal detection with the Ring Indicator (pin 22 of RS-232
connector), or Carrier Detect (pin 8 of RS-232), or software
signal detection for the Icom R72, R7100, and R9000 radios.
Radio Manager works with the ICOM CT-17 interface, but
it will not stop scanning when a signal is present, unless you
modify your CT-17 as described in the help file or have a radio
listed above that supports software detection. A 9600 BPS
connection is strongly recommended.
* An Icom R-7000, R7100, or R9000 radio, or a Pro 2005/6 scanner with
an OptoScan456. Other Icom radios should work too, but only
the R-7000 has been tested by me. Please let me know if your radio
works or doesn't work. Works best when communication between

computer and radio is set to 9600 bps.

3359. The Optoelectronics thingy for the Pro-2006

Newsgroup: rec.radio.scanner
Date: 1994-10-06 05:05:10 UTC
From: davidm@iglou.com
Message-ID: <6MuakK7gXz-2072yn@iglou.com>
Source record: 267672

Okay, now its my turn to ask a question about the Optoelectronics gizmo for the 2006 (I forget the model number, and its too late to go hunting for the magazine ad :-))

With this thing installed, can you re-organize the bank structure, or are you still stuck with 10 banks of 40 channels? I'd rather have 40 banks of 10 channels. I was interested in the new Radio Shack scanner (if it ever comes out) that has a thousand channels, until I found out it was 10 banks of 100 channels. A hundred banks of 10 channels would be perfect!

DSA> go. Is Radio Shack really that bad? there's one nearby and it would be
DSA> pretty convenient, but I need to know what to look for and what
DSA> questions to ask. Thanks in advance....

Hi, Dave...
The only thing unpopular about Radio Shack is their sale techniques and knowledge. Other than that, some of their scanners are excellent. The ever popular Pro-43 handheld scanner is their top of the line handheld and is on sale now (as of Sept. 24) for $299. Their former top of the line base 2006 is also an excellent scanner. You might still find some around. The current top of the line is the 2035 and runs for $450. Might be a bit steep on the wallet, though.

What are you interested in listening to? Police and fire? Air communications? Cordless phones? Amatuer Radio operations?

Next, you will have to find out what the frequencies are that you want to monitor. Many police depts are switching to new radio systems, hence the amount of new scanners capable of receiving 800 Mhz frequencies. In some cases, an RS person may be able to help, but it is best to pick up a copy of the book Police Call for your area at RS. Cost is $10. This book will have almost all of the freqs that are licensed by the towns in your area.

Then you will have to figure out how many channels you want? 2035 has 1000 channel capability. 2006 has 400. '43 has 200. There are alot of different types of scanners with different features.

The basics...

Delay...Scanner holds on to channel received for 2 seconds after end of transmission to see if there is a reply. If not, the unit will continue scanning.

Search...Program lower and upper limits to search in a given range. For example, I may want to search between 154 and 155 Mhz to see what activity may exist in this area.

Bells and whistles include...

Instant weather button to monitor the National Weather Service without taking up a channel.

Priority...Periodically checks a channel to see if activity is occurring and if there is, will override any other transmissions being received.

Auto Search and Store...will search a desired range and when radio traffic is detected, will automatically save that freq into a channel.

Hit counter...will count how many times the radio received a signal on a given channel.

For starting out, I would recommend the 2030 by Radio Shack. It is a Uniden Bearcat made unit that has 80 channels, 50 channel per second scan rate and covers 800 Mhz. It is easy to program and operate and is not effected too bad by imaging. (A normal occurence in receivers of this design in which the radio will pick up a "mirror" of the actual frequency)

Not sure on a handheld, but many users have reported good results with the Pro-51. The $299 tag is steep and I personally wouldn't pay that much for the unit. If it becomes available again soon, I would try for a '23 if your area doesn't use the 30-50 Mhz range.

You might want to pick up a catalog from RS to take a look at the upcoming selections.

Another to consider is the Uniden Bearcat 220 XLT. You should be able to get one of these at Service Merchandise or Wal-mart possibly. BC 200 was a pretty popular unit and has been discontinued. You may be able to find a good deal on this unit. Both of these units are 200 channels with many of the above features and are handheld units.

Take your time and keep asking questions. Many users have preferences on the type of scanners they buy depending on location and frequency ranges. What may be excellent for one user may be a door stop to another.

You might want to consider picking up Monitoring Times (Barnes & Nobles Superstores usually have them, I've been told) or Popular Communications. They both have lots of info. Pop Com is excellent for someone starting out in the hobby.

I'll let you go...my fingers are overheating. <g>

Source record: 267667

usually the radio/scanner equipment listed in general
interest catalogs is a bit expensive...at least
compared to what you see from grove or tucker or
EEB...so this one caught my eye in the latest
(dated sept 28) offering from "damark"".
they have a uniden 200 xlt for $169. i owned
one of these when they first came out in the
late 80's...and paid $269. cheapest i have
seen them (new) is $209. the damark ones
are 'factory serviced'.
if i recall, this unit is cell-blocked, easily
modified. but scan spacing is 12.5 locked.
this is a nice scanner, which served me well
until i found 200 channels was no longer
sufficient. that was during my "no standards"
period, when i figured if it was worthwhile
transmitting, it was worthwhile listening to.
i had every pizza dispatcher, john deere
combine, and talking sign in town programmed
in. never a dull moment, what i lacked in quality
i made up in quantity.
but i digress...
damark has a toll-free number 800-729-9000.
now the usual disclaimer...
i pass this info along because i think it is
of interest to this news group. i have no
financial, spiritual, or carnal interest in
this company or any of its employees.

Robert Worne (tanuki@kaiwan.com) wrote something:
:
: Adray's, another local dealer sells phones, but they are all
: pre-programmed. They just call up the carrier and activate the number.
: If you already have a number, there are no "unprogrammed phones to
: sell." Therefore you need to pay a "deprogramming fee" of about $100-150
: for the telephone. Shit, I can program a Motorola, OKI, or Panasonic in
: about 30-45 seconds. I'd love a job programming phones for $1600+ bucks
: an hour.

I got's news for you brudda... A reporter friend of mine (Eddie Rivera)
will be doing a story on how some Adray's managers violate the law as far
as Cellular Phone sales... With the reporter on the line, I called up
an Adray's and asked for the manager. I told him I was the assistant
manager at another Adray's in the Valley, and that I was new, my manager
wasn't in, and I wanted to know what I could do because I've had three
customers come in so far and buy phones from me without activation.

He was outraged, and told me that we were losing money! Then he
proceeded to explain how I should tell them ANYONE who calls on the
phone that we only have one or two phones in stock, and then when
someone comes in, if they don't want activation, pretend to go out
into the warehouse to get their "one" phone, and come back to tell
them that we must have just sold the last one, and the computer must
not have been updated yet. He then proceeded to tell me that I could
also go out to the warehouse, get a phone, open up the box, and take
the battery and charger out. Then bring it out, open it up, and find
the items missing - and tell the customer that it's the last one, and
if he wants it he'll have to buy a battery and charger from us!!!!!!
He even told me that "you don't want to make it seem like you're
breaking the law - so always pretend to 'go check' for them, and
act disappointed when the last one is gone"... What a jerk.

You'll be reading about these practices in the paper...

In article <9407280650.09LSN00@chrysalis.org>, jeff.wright@chrysalis.org writes:

I got up this morning, went to my truck and turned on the 2026, and it had lost all of its stored channels.

Yes, I have had the same problem. I have taken 2 of these scanners back to Radio Shack and they have replaced them with new ones off the shelf (knowing the manager helps!), but they all seem to have the same problem intermittently. My current one has again lost all freqs. I am having some success to tracing it to things such as starting the vehicle accidentally with the headlights on, or cold weather, etc. But even this is not proving consistent, I plan to wire direct to my auxillary battery and bypass the cars system all together and see if this helps. As with all intermittent problems it is very frustrating.
BTW this is the later model scanner. Any additional info on this problem would be appreciated. Please email to 73631.3327@compuserv.com

Thanks!

Dear boy, in areas like Southern California, 400 channels is barely a start. With reasonable divisions into banks (which typically wastes several channels per bank), 400 channels will just about handle the combined law enforcement agencies of Los Angeles, Orange, and San Diego counties.

CHP alone fills one 40-channel bank; LAPD pretty much takes up another; and so on.

I've got a very numb Pro-2004. It was fine in January, it was packed away, and is numb upon unpacking.

I took it to RS and the estimate came back "Replace receiver board". Sounds to me like somebody is working at a peicework rate. I understand that sometimes swapping the board is the only solution - but I'd rather get a second opinion.

Any pointers to a good shop in the L.A. basin would be appreciated.

I was wandering if the uniden 200XLT or the uniden BC2500XLT in the last damark catalog, listed as factory serviced, could have been modified in the factory to be unmodifiable? Or is RS the only one that is changing its models that way (like the 'A' in the 43). And would you trust an item that was 'factory serviced' more than a new product, since they were inspected better?!? the second time they left the factory. It's just that the factory service models are marked about $40 less than the new ones, and I was wandering if it is worth the risk of getting 'factory serviced' merchandise, especially with all the new FCC rules coming out.

From: brett_miller@ccm.hf.intel.com (Brett Miller - N7OLQ)
Newsgroups: rec.radio.scanner
Date: Mon, 18 Jul 1994 13:16:49

Here is some info that I think was originally posted by Dave Emery:

The following summary describes the coding used on POCSAG pager
signals and may be of interest to those curious about what those ear-splitting
beeps and buzzes mean and how they encode data. This summary is
based on a very old text of the standard from my files; the current
text of the POCSAG standard is available as CCIR Radiopaging Format 1.

Note that some current POCSAG signals (so called Super-POCSAG)
transmit paging at 1200 or 2400 baud instead of the 512 baud I refer to
here, but use essentially a similar coding standard.

The interested USA reader is reminded that willfully intercepting
other than tone only paging is a violation of the ECPA with similar
penalties and criminal status to willfully intercepting cellular phone calls.

The interested reader is advised that at least two of Universal
Shortwave's RTTY reading devices (the M8000 and the new C-400) are
capable of reading at least the older 512 baud version of POCSAG paging,
so commercial devices for this purpose are currently being sold in
the USA.

And finally, much alphanumeric paging - particularly that installed
some time ago, uses a proprietary Motorola encoding format called
GOLAY which is quite different from POCSAG. The two can be told apart
by their baud rates - GOLAY is 600 baud.

POCSAG

First POCSAG stands for Post Office Code Standarization Advisory
Group. Post office in this context is the British Post Office
which used to be the supplier of all telecommunications services in
England before privatization.

POCSAG as defined in the standard, (original POCSAG) is 512 bits
per second direct FSK (not AFSK) of the carrier wave with +- 4.5 khz shift
(less deviation than that is used in some US systems). Data is

NRZ coded with the higher frequency representing 0 (space) and the
lower one representing 1 (mark).

The basic unit of data in a POCSAG message is the codeword which
is always a 32 bit long entity. The most significant bit of a codeword
is transmitted first followed immediately by the next most significant
bit and so forth. The data is NRZ, so that mark and space values (plus
and minus voltages) as sampled on the output of the receiver
discriminator at a 512 hz rate corrospond directly to bits in the
codeword starting with the MSB. (Note that the audio output circuitry
following the discriminator in a typical voice scanner may considerably
distort this square wave pattern of bits, so it is best to take the
signal directly off the discriminator before the audio filtering).

The first (msb) bit of every POCSAG codeword (bit 31) indicates
whether the codeword is an address codeword (pager address) (bit 31 = 0)
or a message codeword (bit 31 = 1). The two codeword types have
have different internal structure.

Message codewords (bit 31 = 1) use the 20 bits starting at bit
30 (bit 30-11) as message data. Address codewords (bit 31 = 0) use 18
bits starting at bit 30 as address (bits 30-13) and bits 12 and 11 as
function bits which indicate the type and format of the page. Bits 10 through
1 of both types of codewords are the bits of a BCH (31,21) block ECC
code computed over the first 31 bits of the codeword, and bit 0
of both codeword types is an even parity bit.

The BCH ECC code used provides a 6 bit hamming distance between
all valid codewords in the possible set (that is every valid 32 bit
codeword differs from ever other one in at least 6 bits). This makes
one or two bit error correction of codewords possible, and provides
a robust error detection capability (very low chance of false pages).
The generating polynomial for the (31,21) BCH code is x**10 + x**9
+ x**8 + x**6 + x**5 + x**3 + 1.

Codewords are transmitted in groups of 16 (called batches), and
each batch is preceeded by a special 17th codeword which contains a
fixed frame synchronization pattern. At least as of the date of the
spec I have, this sync magic word was 0x7CD215D8.

Batches of codewords in a transmission are preceeded by a start
of transmission preamble of reversals (10101010101 pattern) which must
be at least 576 bits long. Thus a transmission (paging burst) consists
of carrier turnon during which it is modulated with 512 baud reversals
(the preamble pattern) followed by at least 576/512 seconds worth of
actual preamble, and then a sync codeword (0x7CD215D8), followed by 16
data/address codewords, another sync codeword, 16 more data/address
codewords and so forth until the traffic is completely transmitted. As
far I am aware there is no specified postamble. I beleive that all 16
of the last codewords of a transmission are always sent before the
carrier is shut off, and if there is no message to be sent in them the
idle codeword (0x7A89C197) is sent. Later versions of the standard may

have modified this however.

In order to save on battery power and not require that a pager
receive all the bits of an entire transmission (allowing the receiver
to be turned off most of the time, even when a message is being transmitted
on the channel) a convention for addressing has been incorperated which
splits the pager population into 8 groups. Members of each group
only pay attention to the two address code words following the synch
codeword of a block that corrospond to their group. This means that
as far as addressing is concerned, the 16 codewords in a batch are
divided into 8 frames of two codewords apiece and any given pager
pays attention only to the two in the frame to which it assigned.

A message to a pager consists of an address codeword in the
proper two codeword frame within the batch to match the recipients frame
assignment (based on the low three bits of the recipient's 21 bit
effective address), and between 0 and n of the immediately following
code words which contain the message text. A message is terminated by
either another address code word or an idle codeword. Idle codewords
have the special hex value of 0x7A89C197. A message with a long text
may potentially spill over between two or more 17 codeword batches.

Space in a batch between the end of a message in a transmission and
either the end of the batch or the start of the next message (which of
course can only start in the two correct two codeword frame assigned to
the recipient) is filled with idle codewords. A long message which
spills between two or more batches does not disrupt the batch structure
(sync codeword and 16 data/address code words - sync code word and
16 data/address codewords and so forth) so it is possible for a pager
not being addressed to predict when to next listen for its address and
only turn on it's receiver then.

The early standard text I have available to me specifies a 21 bit
address format for a pager (I beleive this has been extended since)
with the upper 18 bits of a pager's address mapping into bits
30-13 of the address codeword and the lower 3 bits specifiying which
codewords within a 17 codeword batch to look at for possible messages.
The address space is further subdivided into 4 different message classes
as specified by the function bits (bits 12 and 11 of a codeword). These
address classes corrospond to different message types (for example
bits 12 and 11 both zero indicate a numeric message encoded in 4 bit BCD,
whilst bits 12 and 11 both set to 1 indicate an alpha message encoded
in 7 bit ASCII). It was apparently envisioned that a given pager could
have different addresses for different message types.

There are two message coding formats defined for the text of messages,
BCD and 7 bit ASCII. BCD encoding packs 4 bit BCD symbols 5 to a codeword
into bits 30-11. The most significant nibble (bits 30,29,28,27) is the
leftmost (or most significant) of a BCD coded numeric datum. Values beyond 9
in each nibble (ie 0xA through 0xF) are encoded as follows:

0xA Reserved (probably used for something now - address extension ?)
0xB Character U (for urgency)
0xC " ", Space (blank)
0xD "-", Hyphen (or dash)
0xE ")", Left bracket
0xF "(", Right bracket

BCD messages are space padded with trailing 0xC's to fill the codeword. As far as I know there is no POCSAG specified restriction on length but particular pagers of course have a fixed number of characters in their display.

Alphanumeric messages are encoded in 7 bit ASCII characters packed into the 20 bit data area of a message codeword (bits 30-11). Since four seven bit characters are 21 rather than 20 bits and the designers of the standard did not want to waste transmission time, they chose to pack the first 20 bits of an ASCII message into the first code word, the next 20 bits of a message into the next codeword and so forth. This means that a 7 bit ASCII character of a message that falls on a boundary can and will be split between two code words, and that the alignment of character boundaries in a particular alpha message code word depends on which code word it is of a message. Within a codeword 7 bit characters are packed from left to right (MSB to LSB). The LSB of an ASCII character is sent first (is the MSB in the codeword) as per standard ASCII transmission conventions, so viewed as bits inside a codeword the characters are bit reversed.

ASCII messages are terminated with ETX, or EOT (my documentation on this is vague) and the remainder of the last message codeword is padded to the right with zeros (which looks like some number of NULL characters with the last one possibly partial (less than 7 bits)).

The documentation I have does not specify how long a ASCII message may be, but I suspect that subsequent standards have probably addressed the issue and perhaps defined a higher level message protocol for partitioning messages into pieces. The POCSAG standard clearly does seem to allow for the notion of encoding messages as mixed strings of 7 bit alpha encoded text and 4 bit BCD numerics, and it is at least possible that some pagers and paging systems use this to reduce message transmission time (probably by using some character other than ETX to delimit a partial ASCII message fragment).

Well, I live 2 miles from a major public service and broadcast radio site. My scanners and my Icom 2m handheld get hammered with intermod and desense. I'm currently using an HTX202 for a base 2m rig! No intermod, 7W up the coax on a gell-cell. I used to lose simplex contacts everytime some pager fired up, not anymore.

True, they won't pick up the police, but scanners do that better anyway. You'll note that most scanners have image and intermod problems.

3378. RF Spectrum Analyzers: info req

Newsgroup: rec.radio.scanner
Date: 1994-10-06 15:34:55 UTC
From: jlbowman@indyvax.iupui.edu
Message-ID: <1994Oct6.103455.8891@ivax>
Source record: 267693

Does anyone have knowledge/experience with radio spectrum analyzers out there? I am looking for a nice general, test, RF spectrum analyzer to use in the shack for testing and to look for RF activity from 40-1200 MHz. A decent sample scan rate or congruent/parallel search would be ideal with the notion of approx. 20MHz width and easily capable of quick/selective narrowing of the width when activity is detected. I have a bit of info about the Icom R9000 and Standard CC708, but very limited idea of what else is out there on the market.

Having as many channel as possible is a must for monitoring the UHF-military air band. I used up over 100 channels entering in frequencies from the Northeast Military Frequency book. These were enough to cover a 4 state wide listening area (just air-tower comms). The wider the coverage of the scanner, the more channels you'll need.

100 feet or more? Forget the RG-8, use Belden type 9913. Stiff as hell but
much less attenuation over long runs on the higher frequencies. It will make
a difference!

I'm considering purchasing a BC 8500XLT. I've been following this newsgroup for a couple of weeks but haven't seen in messages about it. I'm not interested in the cell phone freq's or doing any other mods on the unit.

One other question: Does Canada have the same restrictive laws on scanners that the U.S. does? I.e., do scanners get shipped to Canada that are currently illegal in the U.S. ?

Thanks!

If you want to monitor WHCA/SS freqs and don't want to monitor the DVP white noise but want to be able to catch clear voice comms, use a CTCSS-capable scanner and monitor the frequencies with the tone of 103.5 Hz. It works! Most SS comms in clear voice now use 103.5 Hz, whereas they used to use carrier squelch.

I bought a AOR 1000 a few months ago and ahve found it to be suprisingly good! About a month ago I purchased a PR0 2006 and spent some time comparing it side by side with the AOR 1000. Result- I returned the 2006 as I found it won't do anything noticeably better than my AOR 1000. On weak signals the 2006 and the AOR 1000 matched up very close across the bands. Of course the 2006 was louder but that is about all.

On the negative side the AOR 1000 is pretty much dead on the low end - i.e below 5 or 10 Mhz or so - but then again the 2006 and other monitiors don't even go this low.

Give the AOR 1000 a try- they are still avalaible I believe in the full .5 - 1200 Mhz unblocked version.

Why not?? They "allowed" such a stupidly easy to restore "forbidden"
frequencies
in the Pro 2006. Do you really think that they are in the business of
taking the time
to check every possibility of every scanning receiver, and then telling
the manufacturers
that they have not gone far enough in locking out the frequencies? I think not.

In article <370nl0$m05@horos.kbfi.ee> ott@anubis.kbfi.ee (Ott Kostner) writes:

>I will appreciate if someone could help me in decoding POCSAG code. The
>POCSAG code is a standard for radio paging.

>Please help.

Here is the only technical info I have seen on POCSAG so far.

From: die@pig.UUCP (Dave Emery)
Newsgroups: alt.radio.scanner,rec.radio.shortwave,rec.radio.amateur.misc
Subject: Summary of how POCSAG paging works
Date: 21 May 93 01:30:02 GMT
Followup-To: alt.radio.scanner
Organization: Opinion Mongers Incorperated...

The following summary describes the coding used on POCSAG pager
signals and may be of interest to those curious about what those ear-splitting
beeps and buzzes mean and how they encode data. This summary is
based on a very old text of the standard from my files; the current
text of the POCSAG standard is available as CCIR Radiopaging Format 1.

Note that some current POCSAG signals (so called Super-POCSAG)
transmit paging at 1200 or 2400 baud instead of the 512 baud I refer to
here, but use essentially a similar coding standard.

The interested USA reader is reminded that willfully intercepting
other than tone only paging is a violation of the ECPA with similar
penalties and criminal status to willfully intercepting cellular phone calls.

The interested reader is advised that at least two of Universal
Shortwave's RTTY reading devices (the M8000 and the new C-400) are
capable of reading at least the older 512 baud version of POCSAG paging,
so commercial devices for this purpose are currently being sold in
the USA.

And finally, much alphanumeric paging - particularly that installed
some time ago, uses a proprietary Motorola encoding format called
GOLAY which is quite different from POCSAG. The two can be told apart
by their baud rates - GOLAY is 600 baud.

POCSAG

First POCSAG stands for Post Office Code Standarization Advisory
Group. Post office in this context is the British Post Office
which used to be the supplier of all telecommunications services in
England before privatization.

POCSAG as defined in the standard, (original POCSAG) is 512 bits
per second direct FSK (not AFSK) of the carrier wave with +- 4.5 khz shift
(less deviation than that is used in some US systems). Data is
NRZ coded with the higher frequency representing 0 (space) and the
lower one representing 1 (mark).

The basic unit of data in a POCSAG message is the codeword which
is always a 32 bit long entity. The most significant bit of a codeword
is transmitted first followed immediately by the next most significant
bit and so forth. The data is NRZ, so that mark and space values (plus
and minus voltages) as sampled on the output of the receiver
discriminator at a 512 hz rate corrospond directly to bits in the
codeword starting with the MSB. (Note that the audio output circuitry
following the discriminator in a typical voice scanner may considerably
distort this square wave pattern of bits, so it is best to take the
signal directly off the discriminator before the audio filtering).

The first (msb) bit of every POCSAG codeword (bit 31) indicates
whether the codeword is an address codeword (pager address) (bit 31 = 0)
or a message codeword (bit 31 = 1). The two codeword types have
have different internal structure.

Message codewords (bit 31 = 1) use the 20 bits starting at bit
30 (bit 30-11) as message data. Address codewords (bit 31 = 0) use 18
bits starting at bit 30 as address (bits 30-13) and bits 12 and 11 as
function bits which indicate the type and format of the page. Bits 10 through
1 of both types of codewords are the bits of a BCH (31,21) block ECC
code computed over the first 31 bits of the codeword, and bit 0
of both codeword types is an even parity bit.

The BCH ECC code used provides a 6 bit hamming distance between
all valid codewords in the possible set (that is every valid 32 bit
codeword differs from ever other one in at least 6 bits). This makes
one or two bit error correction of codewords possible, and provides
a robust error detection capability (very low chance of false pages).
The generating polynomial for the (31,21) BCH code is x**10 + x**9
+ x**8 + x**6 + x**5 + x**3 + 1.

Codewords are transmitted in groups of 16 (called batches), and
each batch is preceeded by a special 17th codeword which contains a
fixed frame synchronization pattern. At least as of the date of the
spec I have, this sync magic word was 0x7CD215D8.

Batches of codewords in a transmission are preceeded by a start
of transmission preamble of reversals (10101010101 pattern) which must
be at least 576 bits long. Thus a transmission (paging burst) consists
of carrier turnon during which it is modulated with 512 baud reversals
(the preamble pattern) followed by at least 576/512 seconds worth of
actual preamble, and then a sync codeword (0x7CD215D8), followed by 16
data/address codewords, another sync codeword, 16 more data/address
codewords and so forth until the traffic is completely transmitted. As
far I am aware there is no specified postamble. I beleive that all 16
of the last codewords of a transmission are always sent before the

carrier is shut off, and if there is no message to be sent in them the idle codeword (0x7A89C197) is sent. Later versions of the standard may have modified this however.

In order to save on battery power and not require that a pager receive all the bits of an entire transmission (allowing the receiver to be turned off most of the time, even when a message is being transmitted on the channel) a convention for addressing has been incorperated which splits the pager population into 8 groups. Members of each group only pay attention to the two address code words following the synch codeword of a block that corrospond to their group. This means that as far as addressing is concerned, the 16 codewords in a batch are divided into 8 frames of two codewords apiece and any given pager pays attention only to the two in the frame to which it assigned.

A message to a pager consists of an address codeword in the proper two codeword frame within the batch to match the recipients frame assignment (based on the low three bits of the recipient's 21 bit effective address), and between 0 and n of the immediately following code words which contain the message text. A message is terminated by either another address code word or an idle codeword. Idle codewords have the special hex value of 0x7A89C197. A message with a long text may potentially spill over between two or more 17 codeword batches.

Space in a batch between the end of a message in a transmission and either the end of the batch or the start of the next message (which of course can only start in the two correct two codeword frame assigned to the recipient) is filled with idle codewords. A long message which spills between two or more batches does not disrupt the batch structure (sync codeword and 16 data/address code words - sync code word and 16 data/address codewords and so forth) so it is possible for a pager not being addressed to predict when to next listen for its address and only turn on it's receiver then.

The early standard text I have available to me specifies a 21 bit address format for a pager (I beleive this has been extended since) with the upper 18 bits of a pager's address mapping into bits 30-13 of the address codeword and the lower 3 bits specifiying which codewords within a 17 codeword batch to look at for possible messages. The address space is further subdivided into 4 different message classes as specified by the function bits (bits 12 and 11 of a codeword). These address classes corrospond to different message types (for example

bits 12 and 11 both zero indicate a numeric message encoded in 4 bit BCD, whilst bits 12 and 11 both set to 1 indicate an alpha message encoded in 7 bit ASCII). It was apparently envisioned that a given pager could

have different addresses for different message types.

There are two message coding formats defined for the text of messages, BCD and 7 bit ASCII. BCD encoding packs 4 bit BCD symbols 5 to a codeword into bits 30-11. The most significant nibble (bits 30,29,28,27) is the leftmost (or most significant) of a BCD coded numeric datum. Values beyond 9 in each nibble (ie 0xA through 0xF) are encoded as follows:

0xA Reserved (probably used for something now - address extension ?)
0xB Character U (for urgency)
0xC " ", Space (blank)
0xD "-", Hyphen (or dash)
0xE ")", Left bracket
0xF "(", Right bracket

BCD messages are space padded with trailing 0xC's to fill the codeword. As far as I know there is no POCSAG specified restriction on length but particular pagers of course have a fixed number of characters in their display.

Alphanumeric messages are encoded in 7 bit ASCII characters packed into the 20 bit data area of a message codeword (bits 30-11). Since four seven bit characters are 21 rather than 20 bits and the designers of the standard did not want to waste transmission time, they chose to pack the first 20 bits of an ASCII message into the first code word, the next 20 bits of a message into the next codeword and so forth. This means that a 7 bit ASCII character of a message that falls on a boundary can and will be split between two code words, and that the alignment of character boundaries in a particular alpha message code word depends on which code word it is of a message. Within a codeword 7 bit characters are packed from left to right (MSB to LSB). The LSB of an ASCII character is sent first (is the MSB in the codeword) as per standard ASCII transmission conventions, so viewed as bits inside a codeword the characters are bit reversed.

ASCII messages are terminated with ETX, or EOT (my documentation on this is vague) and the remainder of the last message codeword is padded to the right with zeros (which looks like some number of NULL characters with the last one possibly partial (less than 7 bits)).

The documentation I have does not specify how long a ASCII message may be, but I suspect that subsequent standards have probably addressed the issue and perhaps defined a higher level message protocol for partitioning messages into pieces. The POCSAG standard clearly does seem to allow for the notion of encoding messages as mixed strings of 7 bit alpha encoded text and 4 bit BCD numerics, and it is at least possible that some pagers and paging systems use this to reduce message transmission time (probably by using some character other than ETX to delimit a partial ASCII message fragment).

: David
: davidm@iglou.com

Yes you can. The channels are stored to disk and not in the 2006. After
the OS456 is installed it does not really make any difference where the
freqs are stored. You could have 100 banks with 2 channels per bank, or
10 banks with 100 channels per bank, etc.

I have one, and I think that it is worth it. Installing takes an hour or
so, so figure it an evening or weekend project.

It *really* complements the 2006.

> doing it but I haven't been able to find much in the way of info.

Probably the most common form of wx data (as opposed to FAX charts) transmitted on short wave is RTTY SYNOP data. Usually tx'ed at 50 baud but sometimes 75.

It looks like group of numbers when you receive it, and there are systems available for decoding and plotting it onto map overlays. The data consists of reports form local stations - updated every 3 hours.

Some frequencies to listen on are:-

Bracknell - 4489kHz and 10551.3kHz
Hamburg Meteo - 4583kHz, 7646kHz and 11638kHz

These are all 50 baud.

ICS Electronics in the UK (+44 903 731101) can provide an excellent PC software system for decoding it. Included in the system is an interface which connects between the external speaker socket on your radio and the serial port on your PC.

Most of us here in NE are preparing for our regional New England flea market Hosstraders in Rochester NH Fairgrounds starting Friday Oct 7th at 9:00 AM! Its the best flea ever - really a big tailgate party with some good stuff cheap! Hard-core Hosstraders get there early on Friday and pay $20.00 (until 3:00PM when it drops to $5.00) to get a "good" spot to set up. There are usually some great deals on Friday. Saturday it starts at the crack of dawn and it gets pretty crowded by 10 AM. Sales are usually pretty good for those who are inclined to do so. I always have a table of stuff and right now I have many GRC-109 transmitters to find homes for. It starts to wind down around noon and people start to head out around 2. The place is empty at 4.

The Hosstraders semi-annual flea market and tailgate fest is always a real winner. It seems that almost everyone goes home happy. So if you've never been to it (it used to be at the Deerfield NH Fair Grounds abd it was called Deerfield) take a drive up I-95 to Portsmouth NH then head north on Route 16 AKA the (Captain) Spaulding Turnpike to exit 13, turn right and into the

: I guess this is why US cell carriers fought to outlaw cellular-receiving
: scanners. It's cheaper to buy 'protection' for your customers than to
: redesign your system and force your customers to buy new equipment.
: <*sigh*> Listen to a radio, go to jail. What country is this?

I agree, last I heard, cordless phones were not offered the same
monitoring protection that cellulars have. Isn't a phonecall a phonecall?
I rebmember a special report on the "megabucks" the cellular companies
are losing through fraudulent telephones. While this beef is legit on
their part, the news went for a "ride-along" with the police that were
looking for illegal cell-phones. They had a box that read the ESN off
the phone and checked to see if it was legit. Another thing that was
conspicuous in their car was the scanner that was monitoring the cellular
frequencies. <sigh>

: Pagers, though, have no laws protecting then from the 'must purchase
: service contract to get this price' bullsh*t.

True, try and call one through some pay phones now in LA, its becoming
more popular for the private pay-companies to disable the DTMF pad after
connecting with another party (to cut down on drug-dealing I heard)

>---
>I only speak for me...

Thanks for your post.

According to Monitoring Times, this bill is only going to make it illeagal to clone
cell phones.

It also makes it illeagal to manufacture or import scanners capable of monitoring
cell phone (BECAUSE the SENATORS HAVE SOMETHING TO HIDE WHEN THEY ARE USING THAT

CELL PHONE)! Anyway. Mostly all hackers are capable of modifying scanners to have full unblocked coverage. My AOR AR1500 is completely open and supports .5 to 1300Mhz. No gaps full coverage. It even has a BFO to support shortwave.

I think most of us have to look out. The Constitution is getting ammended constantly and they are stripping away our rights! Before you know it the right to bear arms will be a thing of the past! ALSO SOON we will be presumed guilty until proven innocent.

It's getting scary. Too many people are busy watching television and are not into paying attention!

3411. Service For Sick PRO-43 in Houston?

Newsgroup: rec.radio.scanner
Date: 1994-10-07 01:58:34 UTC
From: dcs@dcsborg.cls.com
Message-ID: <BcZsTc1w165w@dcsborg.cls.com>
Source record: 267684

Quick synonpsis: Any good places in US or Houston, TX (preferred)
to get a sick PRO-43 out of warranty fixed?

Earlier today, while listening to my well used PRO-43 scanner
at work, we had a little accident. As I moved from one 'puter
terminal to the next, my foot hooked the power adapter cord
to my scanner, and it tumbled to the floor. This was not the
first time that this happened, but the poor scanner did not
recover! Seems the power jack is now mangled, and the antenna
jack solder snapped. The second I could fix, but I don't think
that's what is keeping it from working. It won't work with
either batteries or power adapter. Any ideas? Suggestions of
reputable folks who can fix it for me? 300 bucks for a new
one? :-)

Mucho thanks,
Dave

Definately not true for Houston. I think the only time I've heard
SS use DVP was during Clinton's last visit. Normal operations and
the G. Bush gang are all in the clear.

[...]
: Any clues?

Yes. This unit and its little brother the 100 had a problem where the
antenna wire from the BNC connecter to it's little hole in the PC board
would come loose at the PC board. You may want to go in there and take
a look see, or better yet just re-solder the connection and the board.
Sound like you have no antenna (connection).

: Why not?? They "allowed" such a stupidly easy to restore "forbidden"
: frequencies
: in the Pro 2006. Do you really think that they are in the business of
: taking the time
: to check every possibility of every scanning receiver, and then telling
: the manufacturers
: that they have not gone far enough in locking out the frequencies? I think not.

That was before the ECPA. Note that, when it was found that a particular
RS scanner could have cellular restored by clipping a wire - RS was required
to pull it form the shelves.

They cannot check every possibility, which is why they missed the programmable
"test mode". But, it is trivial for them to pull type certification - leaving
the manufacturer with a stock of radios that can no longer be legally sold in
the US. As such, they do not have to test the radios.

If you checked with the manufacturer, you would find that no 2006 scanners
have been manufactured since last April, unless there is a version that is
not easily modifiable.

I suspect that the manufacturers will go the easy route and, on new models,
simply lock out the cellular frequencies on all radios - no matter which
country for which they are meant.

: Replacing the ROM is not easy for the average hacker...
:

But, that is NOT what the ECPA states. It simply says easily modifiable.
Replacing a ROM or PROM is easy, for a technician or average electronics
experimenter. Thus, such a scanner would be banned - as soon as the FCC
found out about it.

Now, I have no idea what they would do about a CPU with the band locked
out in ROM on the chip, but with a replacement CPU available as a repair
part from another country. Whether they would consider this to be an
easy mod will not be known until some manufacturer tries this method.

Do any cellular telephones come with relatively standard microprocessors where datasheets describing instruction sets and/or development tools (a debugger, assembler, eprom burner, in circuit emulator) might be available to facilitate disassembly, rewriting, assembly & installation in perhaps minimally modified cellular telephone? Motorola 68HC11, Intel 8051, etc.

No, the whole thing is digital. Forget trying to listen to it with your
scanner (any scanner).

I just bought a Trident TR-2400 hand scanner from ACE Communications.
It's a nice wide range unit: 100khz - 2060mhz with only the cellular
range locked out. Does anyone have any information on this scanner
and how one might re-activate the 800mhz block, if one so desired?

Also, I'm interested in finding out what the actual shuttle to ground
frequencies (and vice versa) for NASA. I think I heard it was in the
220-400mhz range, but also somewhere in the S-BAND. Where is that?

thanks
dave

I had that same problem with mine!!! BearCat Quality or design problem?

There's a regulator on one of the boards that smoked. It's a surface
mount part so you will have to send it in for repair. The cost for that
repair is about $45.00 + shipping.

This is POCSAG 1200 message, started by 55 55 (01010101) preamble and the message body. It is easy to receive that data. All you have to do is to connect the output of standard pager receiver output (no matter, numeric or alpha) to RS-232 serial card input. Note that signal levels are different. RS-232 requires +-12V, pager receiver gives output of ~1.5 V. This is sufficient for TTL input. The easiest to obtain this signal is to take an ordinary computer I/O card and cut PCB wire between the voltage converter and serial receiver input.

OK. Hope I can decode this message.

Regards,
Ott Ko"stner

CMG> Would someone please email me a copy of the US 10-codes. I've lost the
CMG> list I had of them!

Hi, Chris...
The problem with 10 codes in the US is that they are not the same across
the United States. Some depts use the codes differently than another dept.
10-1 in one area may mean good signals and could mean a fight in progress
in another area.

If you could be more specific in what dept or state you are in, you may
get more accurate responses. :)

Take it EZ...Jerry

Do either of you, or anyone else reading this, know the exact definition in
these statutes of the word "import"? We Canadians are interested as we
are concerned that when we visit the U.S. with our cellular capable
scanners we may be "importing" them, even though we are only bringing them
into the U.S. for our own use and temporarily at that. As a lawyer, I
have access to some U.S. law databases, but do not have access to the
statutes about which you are writing, nor to the U.S. Customs legialation
which, no doubt, defines "importing". Thanks for your help.

>would make listening this way impossible.

Bingo! DMX stands for _Digital_ Music eXpress. The 30 audio channels we get in Madison, WI are digitally compressed into two video channels. Sorry, but the only way to get DMX is to get the DMX decoder. BTW, you'd be missing the point by receiving DMX in mono on a scanner, since it's CD quality music.

3431. Pop Comms for Sale

Newsgroup: rec.radio.scanner

From: bongik@lemma.math.rpi.edu
Message-ID: <373l8e$m88@usenet.rpi.edu>
Source record: 267621

Howdy all,
Here is a list of Pop Comms I am selling:

'83 Mar. - Dec.
'84 Jan. - Dec.
'85 Jan. - Apr., June, Sept.
'86 Jan. - Mar., May - Aug., Dec.
'87 Dec.
'88 Feb. - Dec.
'89 Jan. - Sept., Dec.
'90 Jan., Aug. - Dec.
'91 Jan. - Sept.

All are in pretty good shape and IMHO contain excellent articles on scanning
(and radio listening in general). I'll sell them all or singly or however.

Go ahead.......make an offer....

p.s.: If you need more specific info about a particular issue, just ask.

That'll never happen. Market dictates type of radio sold to target country.
Contrary to popular opinion, the U.S. market does not dictate international
market directions. The Japanese manufacturers justify separate inventories
for different markets based on profit. It already happens in the communications
transciever market, starting with simple radios like CB's.

It is often cheaper to replace the suspect board than to spend hours of
labor trouble shooting it. How much did they want for the whole repair?

Factory service units are normally in perfect cosmetic/electronic condition
and may be your best bet to getting 800Mhz restorable scanners at a
reasonable price. I've purchased a few Damark factory serviced products
including the BC350A mobile scanner and have been very pleased.

It has been discontinued due to non-correctable performance problems. If you want similar features w/out the alpha numeric display the 890XLT works well, but is only dual conversion. Better yet, get a Pro 2006 if you can find one.

Andy

3438. Pro 43 on sale/ Price protection plan

]
]Does anyone know the exact frequencies scanned in the air fire and marine
]scan modes?
]
]
]Thanks in Advance
]
]Jim

Whew! Here are the frequencies covered by my PRO-51's preset "bands."
Oh well, I had to type it out at some point anyway, since this
information doesn't seem to be documented. The service manual doesn't
mention them either. Assume that these specs (like all others) are
probably subject to change without notice. NOTICE that the "Air" band
includes the DOCUMENTED birdie frequencies, 113.850, 124.200, and
134.550MHz instead of skipping them--Duuuhhhh! Maybe there are
supposed to be birdies in the AIR... :^D

Band 1 "AIR"

108.000-136.975MHz AM @12.5kHz

Band 2 "FIRE"

33.020-33.100MHz @20kHz
33.420-33.980 @20kHz
33.020
33.640
35.680
37.900-37.980 @40kHz
43.640-43.880 @40kHz
45.920-46.000 @40kHz
46.040-46.500 @20kHz
47.420-47.660 @40kHz
150.775
150.790
152.010
153.770-154.130 @60kHz

>channels. A hundred banks of 10 channels would be perfect!

The 456 doesn't use the 2006 memories at all, so you could write your own
software to organize frquencies in any way that you want. I'm not sure
what options are implimented in the software that ships with the 456. On
the down side, you can't stuff frequencies into the 2006 memories since
the 456 essentially takes the 2006's computer side off-line when it the
software starts up.

3447. GRE Super Amplifier ...

Newsgroup: rec.radio.scanner
Date: 1994-10-07 17:17:02 UTC
From: domonkos@access.digex.net
Message-ID: <J7ObkiubGcCR066yn@access.digex.net>
Source record: 267719

Anyone have any experience using the GRE Super Amplifier 100Mhz - 1000Mhz preamplifier? I just installed the RS thru-the-glass scanner antenna and the performance lags the magmount antenna I was using. I'm thinking about installing the GRE Super Amplifier in-line to make up for any losses in the thru-glass system. Anyone have any similar experience (how much noise was added, did it make a significant improvement)? Thanks.

Andy

3448. Radio Shack sells it ALL!

Newsgroup: rec.radio.scanner

3456. My new Pro 43

Newsgroup: rec.radio.scanner
Date: 1994-10-07 20:52:47 UTC
From: lem <lem@mixcom.mixcom.com>
Message-ID: <1994Oct7.205247.23140@mixcom.com>
Source record: 267692

I have the coveted, modified Pro43!

I went through the white pages, calling down the list of Radio Shacks, asking if they had an older Pro43 in stock and I found a small neighborhood store that had one on about the fourth call. I got some pretty weird answers from the other stores, all of them different, ranging from a simple "NO", to "We don't have any in stock, they've all been recalled by the company."

I gave the scanner to my dad to take to work and modify, where they have tiny desoldering tools and magnifying setups.

He said it was pretty easy with the desoldering tool until he got right down to the diode itself which he said was VERY small. He said he could barely see it and he said he never saw the leads at all, so he was working in the dark and it made him very nervous and it took him two hours and he never wants to do it again.

(He's over 50 and his eyesight IS getting pretty bad.)

But anyway, it worked and he did the keybeep too and I love my scanner now.

So, if you want a modified Pro43, you can do what I did. Find one with a serial number that doesn't start with "A" and make sure the FCC ID is AA020-300 and NOT AA020-300A, buy it on sale, and bully someone into modifying it for you.

3457. Freq. for 'Deutsche Welle'??

3459. TR-2400

Newsgroup: rec.radio.scanner
Date: 1994-10-07 22:14:10 UTC
From: dbaker@tiger.lsu.edu
Message-ID: <374h7i$1jsf@tiger1.ocs.lsu.edu>
Source record: 267541

I guess I should have given a little information about the
TR-2400 and whether or not it's a good piece of equipment. I had a
PRO-37 scanner for a long time and it served me well, although it was kind
of limited. The TR-2400 is way beyond the pro-37.

100khz - 2060 mhz range w/ only cellular blocked
NFM, WFM, AM, and SSB reception modes
1000 channels
10 search banks
signal strength readout bar

It seems to be a VERY nice hand scanner, especially the 1300 - 2060 mhz
that most scanners don't get.But guess what? Mine seems defective.
It refuses to scan above 1600.900 mhz. The tech guy at ACE Communications
was no help what-so-ever. He kept saying, "I don't know what to tell you,
did you mess with the squelch?" Of course I messed with the squelch,
that was the FIRST thing I did...If anyone has any suggestions as to what
it may be, please let me know.

dave

btw- the TR-2400 is listed at $449 from ACE Communications.

Good answer... AOR makes a 1000 channel scanner. Like most users of scanners
I have set up banks of frqs. ie: Air, Police etc.. If you have plenty of extra
channels you can duplicate your favourite frqs, in effect boosting the scan
speed.

>Why not?? They "allowed" such a stupidly easy to restore "forbidden"
>frequencies
>in the Pro 2006.

The 2006 was type accepted before the latest ban. Its type acceptance was
revoked as part of that same legislation, i.e. RS will not be making any
more 2006s.

>Do you really think that they are in the business of
>taking the time
>to check every possibility of every scanning receiver, and then telling
>the manufacturers
>that they have not gone far enough in locking out the frequencies? I think not.

I think the PRO-51 adequately demonstrated that the burdon is going to fall on
the manufacturer. Company x asserts that its new scanner is not easily
modified. The FCC grants type acceptance. John Q Public finds a way to modify
it to recieve cellular frequencies. Company x ends up recalling its new

scanner and shipping the units to Canada.

: I think most of us have to look out. The Constitution is getting ammended
: constantly and they are stripping away our rights! Before you know it
: the right to bear arms will be a thing of the past! ALSO SOON we will be
: presumed guilty until proven innocent.

You already are. All the cops have to do is claim that they found some currently illegal drugs, and they can confiscate everything you possess. This includes your bank accounts and retirement savings. They do not even have to charge you with any crime. To get the property back, you will have to sue in civil court - and prove that the property was not purchased with "drug tainted" money. This is rather hard to do, when they have confiscated everything.

There have been cases where, after a person was successful in the local court, the police simply turned everything over to the feds - where the person would have to sue all over again. I have not heard how these came out.

: It's getting scary. Too many people are busy watching television and are not
: into paying attention!

It has been getting scary for over 20 years. Very few people noticed then, and most still are not noticing.

3470. Newbie question 2006/2032?

Newsgroup: rec.radio.scanner
Date: 1994-10-08 03:25:43 UTC
From: glickman@panix.com
Message-ID: <3753fn$1e6@panix.com>
Source record: 267711

I see that many 2006 owners here are saying good things about their units.

Is there that much difference between that model and, say, the 2032 that justifies spending about twice as much? What does one get for the extra money?

I'm looking for a first scanner, and live in New York City. Any suggestions would be appreciated; please Email and I'll post a summary.

Thanks.

selling my pro-43. Reason? well i need the cash. asking price? $275 which includes S&H. What does it include besides S&H? it also has AC adapter cord, manual, original package, and six(6) new batteries. Anything else special to add? well the date on the unit is 9A3 and has been modified for the 800MHZ ranges. it is STRICTLY new (1-1.5 months old) and will provide sales slip if in doubt. please reply by e-mail only. the price is not negotiable. thanks for your time and trust.

I've been following this thread loosly for the last couple of days. There seems to be a big debate over why someone would need 400 channels or not.

I need at least 400 channels on my Pro-43.

Can someone please tell me how to do this. It is one of the unmodifiable ones (for now) but I don't know if this will make a difference.

Please enlighten me. I've had the scanner for four weeks and already run out of channels.

Thanks.

Steve

>is it modifiable by removing a diode similarly to the pro-43?

>/eli

==========

Well I have a Pro-39.....I modifyed it and I really Love it.....
The main difference between the 39 and the 43 is the 43 has
Tripple Convertion.....the 39 only has double, which is a pain
if you listen to Trunked systems, due to the Cellular Images.

All in all though, it is a good scanner for the price.....the mod
is easy and it works!

Hope this helps ya.

After reading, and thinking, about this, I will be writing the Calif.
Atty General's Office, Telemarketing Unit, 300 S Spring St. 5th Floor,
Los Angeles, CA 90013, about my experiences being lied to/ripped-off
by these firms. I would also like to see some local televisions news
stations shop theses stores, to show how these retailers just thumb
their noses at the law. I would suggest all those reading this, to do
the same also. (Writing the proper govt agencies and the proper de-
partments (investigative/consumer reporters) in the media. Only when
these guys are exposed, and penalties assessed, will this crap have

any chance of stopping.

Right now, many cellular retailers work on the assumption that most all customers don't know the law. But if they find out you're a smart consumer, they want to kick you out of the store quick, so no other less-intelligent customers in the store will here you. These guys will never sell you a phone, as all they're interested in is getting commissions from those extended, onerous, cellular service contracts that they'll fast-talk you into.

The newer PRO-43s are apparently not modifiable.
I don't own a PRO-43, so I don't know the full story.
But the older one's were, but I don't have the mod handy right now here to
post. It should be in ftp site oak.oakland.edu somewhere.

ALL PRO-2006s ARE MODIFIABLE. It is a discontinued product, so it
wasn't affected by the law that took effect in May, except for a few that
were produced after the deadline, that were modifiable, which caused Radio
Shack to pull the product off of many of its store's shelves. The mod is
very easy, as it just involves cutting one diode lead with a pair of small
wire cutters. I did the whole procedure in less than 5 minutes.
Below are 2006 mods I have:

From: rats@ihlpm.UUCP

PRO-2006 Modifications

NOTE: The Electronic Communications Privacy Act of 1986 makes it
unlawful to monitor mobile telephones, including cellular. The following
modification is intended only to restore continuous 760-1300 MHz
coverage as originally provided by the design of the PRO-2006
microprocessor.

BE SURE TO TEST YOUR PRO-2006 FULLY BEFORE ATTEMPTING THIS
MODIFICATION. ANY MODIFICATION MAY VOID YOUR WARRENTY.

824-851, 869-896 MHz Frequency Restoration

Tools Required: small Phillips screwdriver, small wire cutters.

Procedure: With the power cord unplugged, remove the two rear
cabinet screws holding the upper cover. Lift off the upper cover,
being careful not to stretch the speaker leads. Examine the inner,
right-hand-corner of the front panel to find two glass diodes, labelled

D503 (upper diode) and D502 (lower diode).

Using the clippers, very carefully snip the visible lead of the lower diode (D502) at its bend and slightly separate the cut ends. If it is ever necessary to send the radio back for warrenty repair, the diode leads should be carefully resoldered.

Reassemble, plug in AC cord, turn on scanner, and press RESET.

Keyboard Beep Delete

With the top cover removed as described above, locate connector CN3, a 15-pin connector with colored wires at the front of the main circuit board. There are two precedures which will stop the beep tone from being heard through the speaker; read both to decide which procedure you want to follow.

(1) Find the center grey wire coming from CN3 and cut it midway to disable the beep tone. You may wish to solder a resistor in series to reduce the beep volume, a trimpot to vary the volume of the beep tone, or a minature switch to choose between beep and no beep.

(or)

(2) Using a pair of needle-nose pliers, CAREFULLY pry the plug from CN3, revealing a row of pins. Locate the center pin (#8) which corresponds to the grey wire and bend it down flat, disabling the beep circuit. Reinsert the plug. The pin may be erected again later to restore the beep tone if desired.

This completes the restoration procedure. Reattach the cover and replace the screws.

WARRANTY REPAIR

Should it be necessary during the first year of ownership of your new PRO-2006 to exercise your warrenty, it should be carefully double-boxed (as you received it) and returned to Grove Enterprises. Be sure to include a copy of the original bill to establish warranty privileges.

You must prepay only shipping and insurance; return shipping and insurance to you will be paid by the dealer.

Grove Enterprises, P.O. Box 98, 140 Dogbranch Road
Brasstown, NC; 1-704-837-9200

|> nvn

There are two diodes behind the "3" key on the keypad.
Clipping one restores cellular, clipping the other
increases scan speed by about 13%. I did this to my
Pro-2006 after the warranty expired and did indeed measure
a 13% scan and search speed increase. I don't think
this has had any adverse effects on the radio although
its theoretically possible that the increased scan speed
might cause the radio to miss some carriers - but this
is purly speculation on my part.

Cheers,
Peter

>already scans *much* faster than the 2004/5 (Hyperscan) with a 12 MHz
>crystal, he cautions that it may or may not work. HAS ANYONE TRIED A
>CRYSTAL FASTER THAN 12 MHZ IN THE PRO-2006?

Yes, I have done the Crystal mod. I used a 16.630 MHz crystal from an old
cordless phone (no bull), and I got a big speed increase (approx. 46 channels
per second).I tried several different crystals, ranging from 16MHz to 39MHz,
and my results seem to indicate that the highest crystal freq. should be about
18 MHz. If the crystal is too fast, the 2006 just uses the 3rd harmonic (ie
a 39MHz crystal operates like a 13Mhz.)

From: ross@novax.llnl.gov

The Scanner Mod Handbook #2 says to replace the 12 MHz crystal with something
faster; however, the author, Bill Cheek, says he hasn't actually tried it. I
haven't either, although I'd be interested in knowing if it is a successful
~~~~~~

mod.
>

Well gang,right after I got my Mod handbook 2, I tore into my 2006. At first I tried a 20 MHz xtal, the processor locked up and not all the LCD display segments were happy (I had already done the diode clip speed mod). So I tried an 18 MHz xtal, same problems. I contacted Cheek (the author) and he reported that 16 MHz was the safe upper limit as he had seen no lockups at that speed and higher speeds had produced lockups on SOME units.

So I changed xtals again.The 16 MHz runs fine without any loss of sensitivity and I find enough delay left to still be able to use it (a faster microprocessor xtal shortens delay time).

My favorite 2006 mod is a wired remote control (Monitoring Times Aug 91 - Bill Cheek). I added a few extra parts and can control the following functions from a six foot detachable cord:Scan, Manual, Search up, and Search down. Searching is a snap when you can't reach the keyboard or it is dark.

Gary

From: IN%"horak@eugene.convex.com" 7-NOV-1992 11:49:43.95
From: horak@eugene.convex.com (David Horak)
Subject: RE: PRO-2006 Scanning Speed Mod.

Well, I changed the crystal in my Pro34, which is the same type of crystal and harder to get to than the 2006; however, I haven't changed the 2006 crystal yet. Some of the following instructions come from the Scanner Mod Handbook Vol. 2 on removing the logic board. Please read it all before doing anything. If you royally screw up your scanner, IT IS NOT MY FAULT!!!!!

Before you start anything, make sure you are at a static safe workstation. Unplug the A/C power cord. Remove the top and bottom covers. Remove the 4 countersunk machine screws from thesides of the front panel, then gently pull the panel away from the main chassis. All wires and cables will have to be disconnected from the top and bottom of the logic board (the board that the crystal is on). This will cause your memory channels to be lost and you will have to reprogram them :-((If you can work around it, you could leave CN-3, a 15 wire connector, connected to save your memories). At this point you may have to desolder a ground wire from the chasses going to the bottom of the logic board metal shield. Next, remove 6 small screws that secure the logic board to the front panel. Then, face the inside of the front panel placed in an upright position and locate the white 13-pin connector (CN-501) at the upper left corner of the board. This connector doesn't have any wires, just metal pins going into it. Gently pry this connector apart with a small flat blade screwdriver and the board should slip away from the plastic front panel and come loose in your hand. Also, you may need to remove the volume and squelch knobs. Desolder the metal shield at six places around the logic board and lift

it up and off the board. This is fairly easy to do with a low wattage soldering iron. Apply pressure with your fingers while the shield is heated at each leg. As the solder melts, that leg of the shield will slip upward and pop free. Now there are two choices. If you have an air sucking soldering iron, you can procede to desolder each of the three leads. If you have a normal iron, this will be impossible. The remaining choice is to crush the crystal with a pair of needle-nose pliars until only three leads remain sticking up off the board. Then you can heat and remove each of the three leads. The center lead is ground. You will only use the outer two leads when installing the new crystal. It would be a good idea to insulate the body of the crystal with shrink tubing (whatever you do, don't use electrical tape!) to avoid it shorting out to another component. The crystal will have to be bent over so that the metal shield can fit back on top of the logic board. Before you completely hook everything back together, get the scanner in a usable state and make sure it works. It would be a real bummer to tear it all apart because something is wrong.

Hope this helps,

David

alt.radio.scanner
Subject: Pro2005/6 SSB MOD HERE!
From: horak@convex.com (David Horak)
Date: Mon, 31 May 1993 18:04:59 GMT

I had a few requests for this mod so I thought everyone would benefit...

This is the mod for adding SSB capability to your Pro2005/2006. It is taken in part from Bill Cheek's Scanner Mod Handbook Volume 1. As long as you have a shortwave receiver with an external antenna jack and capability to tune to 455 KHz, you can interface it to the Pro2006 with this mod. It is best if you use a static safe work environment to perform this mod and you should have some technical knowledge. Also, a schematic would be helpful but is not necessary.

You will need the following parts:

Output jack (I use a 1/8 mini earphone jack but some like a BNC. The 1/8 mono jack is easier to install because you don't have to drill as big a hole in the back of the unit)

.01 uF capacitor

5 Kohm resistor (1/4 watt)

6 inches of mini coax or other shielded cable

A cable to run from the 2006 to your shortwave. I use the shielded cable that has the 1/8 plug on one end and a phono plug on the other end (1992 catalog Radio Shack P/N 42-2444 works for me). The phono

plug is perfect for the antenna input of my DX440 shortwave receiver.

The first step is to remove the cover of the unit and drill a hole in the back of the 2006 for your 1/8 or BNC plug. (You will want to wrap some tape around the drill bit about an inch from the end to keep it from cruising right on into the electronics once it punches through the metal!) Solder the 5K resister to one end of the .01 uF cap. Solder the other end of the cap to the shielded coax wire. Solder the other end of the coax to your 1/8 phono plug (or BNC) and ground the cable at this end. Now that the cable is in place you are ready to connect it to the 455 KHz source which is D33. It is on the top circuit board near the middle left, not too far from a huge capacitor. Solder the end of the resistor to the cathode of D33. (This should be the top of the standup part) Now you can test it out before you put the cover back on to make sure you did everything correct. You should be able to tune to some local airport or CB frequency on your 2006 and receive the same thing on your shortwave (with it tuned to 455 KHz and hooked up to the 2006 of course). If you tune something on your scanner that is SSB, you should be able to switch your shortwave to SSB and tune in the signal just fine. Beware of one thing, since the 2005/6 only tunes in 5 KHz increments minimum, you may notice from time to time that the signal on your shortwave isn't real clear. It may be that you will need to tune the shortwave anywhere from 451 to 459 KHz to tune in the signal well!

If you don't succeed or this description has you baffled you probably shouldn't be doing the mod in the first place. I assume no responsibility for screwups. Good luck

David

3486. The Radio Listening Spectrum

Newsgroup: rec.radio.scanner
Date: 1994-10-08 19:03:23 UTC
From: g9153402@huey.csun.edu
Message-ID: <376qdr$aqv@nic-nac.CSU.net>
Source record: 267540
Cross-posted to: rec.radio.scanner,rec.radio.shortwave

THE RADIO SPECTRUM

This is an approximate look, to help in searching frequencies on a scanner or shortwave radio. Just be aware, having the right frequency may not be enough, in tuning to a certain frequency. The time of day, atmospheric conditions, location, mode you're in (AM, SSB, Narrowband FM, Wideband FM, etc.), and your equipment, are also equally important. You'll find most transmissions are broadcasted in Narrow-band FM. Some main exceptions are shortwave (AM & SSB), commercial AM radio (AM), commercial FM radio (Wideband FM), television (Wideband FM), citizens band radio (AM & SSB), aeronautical communications (mostly AM), and some military VHF/UHF (Wideband FM). Most all scanners will pick a default mode for you, depending on what frequency band you are in. But many scanners also let you manually switch between modes (AM, FM, etc.) and frequency search spacing (5 khz, 12.5 khz, etc.) if the default modes are not correct. Happy Listening!!!

FREQUENCY USES/SERVICES
(in Megahertz unless
otherwise indicated)
---------------------- --

10 - 150 khz Military/government, submarine
(.01 - .15 MHz) communications.

150 - 535 khz Longwave Band, beacons, foreign broadcasts,
(.15 - .535 MHz) maritime.

535 - 1700 khz Your standard AM radio dial.
(.535 - 1.7 MHz)

1.7 - 30 Shortwave/High Frequency Band. Broadcasting,
two-way government, military and commercial
communications, amateur radio, CB radio (approx.
27 MHz), others.
Shortwave - Approx. Range Meter Band
1.8 - 2.0 160*
2.3 - 2.495 120
3.2 - 3.4 90
3.5 - 4.0 80*
3.9 - 4.0 75
4.75 - 5.06 60
5.9 - 6.2 49
7.0 - 7.3 40*

7.1 - 7.35 41
9.4 - 9.9 31
10.1 - 10.15 30*
11.6 - 12.1 25
13.57 - 13.87 22
14.0 - 14.35 20*
15.1 - 15.8 19
18.068 - 18.168 17*
17.48 - 17.9 16
18.9 - 19.02 15
21.0 - 21.45 15*
21.45 - 21.75 13
24.89 - 24.99 12*
25.6 - 26.1 11
28.0 - 29.7 10*
(In general, the lower shortwave frequencies
<higher meter band> are received better during
the night, while higher frequencies are re-
ceived better during the day. There are also
some amateur radio bands between many of these
shortwave bands(*). Consult a shortwave guide
for more detailed information.)

30 - 50 Very High Frequency Band. Government, business,
walkie-talkies. Also, cordless phones and
'baby monitors' found about 46 - 49 MHz.

50 - 54 Amateur radio 6 meter band.

54 - 72 TV Channels 2-4.
Channel 2 Audio (Wideband FM) 59.75
Channel 3 Audio (Wideband FM) 65.75
Channel 4 Audio (Wideband FM) 71.75

72 - 76 Manufacturing, remote control, eavesdropping
bugs, etc.

76 - 88 TV Channels 5-6.
Channel 5 Audio (Wideband FM) 81.75
Channel 6 Audio (Wideband FM) 87.75

88 - 108 Your standard FM radio dial.

108 - 136 Aeronautical communications (AM).

136 - 138 Satellites.

138 - 144 Military communications.

144 - 148 Amateur radio 2 meter band.

148 - 150.8 Military use.

150.8 - 174 Business, highway, law enforcement, government, weather, maritime.

174 - 216 TV Channels 7-13.
Channel 7 Audio (Wideband FM) 179.75
Channel 8 Audio (Wideband FM) 185.75
Channel 9 Audio (Wideband FM) 191.75
Channel 10 Audio (Wideband FM) 197.75
Channel 11 Audio (Wideband FM) 203.75
Channel 12 Audio (Wideband FM) 209.75
Channel 13 Audio (Wideband FM) 215.75

216 - 220 Maritime and aeronautical.

220 - 222 Land mobile communications.

222 - 225 Amateur radio.

225 - 400 Military aviation and space.

400 - 406 Military and government.

406 - 420 U.S. Government.

420 - 450 Amateur radio.

450 - 470 Ultra High Frequency Band. Business, industry, military, fire, government.

470 - 512 TV Channels 14-20, shared with law enforcement.

512 - 824 TV Channels 21-69, others.

824 - 849 Cellular telephones (receivers/handsets).

849 - 851 Aeronautical telephones (ground-based towers).

851 - 866 Business, public safety, trunked systems.

866 - 869 Public safety, law enforcement, trunked systems.

869 - 894 Cellular telephones (towers).
Note: Even though listening to cellular telephone calls is technically illegal in the United States, one will usually do better listening to calls on the tower frequencies, as opposed to the handset frequencies. This is because most cellular phones transmit less than one-watt of output. So unless the cellular phone is very close to you, you will have much more luck scanning the more powerful towers, which transmit/receive for each cell site.

894 - 896 Aeronautical telephones (handsets).
Note: In scanning airplane telephones, you will usually do better listening to the handset

frequencies, instead of the tower frequencies, unless you are very near a ground transmitter. But, in any event, call traffic heard on handset frequencies (which are transmitted from a high-powered transmitter on the aircraft) you may hear nothing at all, or many conversations, depending on your location and time of day.

896 - 901 Private land mobil units.

902 - 928 Land mobile, amateur radio, personal communication units, cordless telephones.

928 - 932 Radio paging.

935 - 940 Business radio.

941 - 944 Government and non-government fixed services.

944 - 952 Broadcasters' studio-to-transmitter links.

952 - 960 Private fixed services, paging.

960 - 1240 Aeronautical navigation.

1240 - 1300 Amateur radio.

1300 - 1350 Aeronautical navigation.

1350 - 1400 Radio location.

1400 - 1427 Radio astronomy.

1427 - 1429 Point-to-point, mobile, space.

1429 - 1660.5 Various satellite transmission uses.

1660.5 - 1668.4 Radio astronomy.

1668.4 - 1700 Meteorological aids.

1700 - 1850 Meteorological satellites, U.S. Government.

1850 - 1990 Fixed point-to-point, microwave.

1990 - 2110 Broadcast studio-to-transmitter links.

the pro46 mod consists of removing two jumbers and inserting one jumper,
but after i removed the first jumper, the block frequencies were restored.
what is the function of the other jumpers?

3488. Re: Radio Shack good stuff

: Possibly not. Radio Shack has the habit of putting returned merchandise back
: on the shelf, and reselling it as new. Maybe someone modified the radio, and
: then returned it for some reason.
: Bill

Oi.. A friend of mine bought a Radio Shack CB, and found that it was defective
a day after, so he took wrote down the SN and took it back.. About a week
later, he convinced me to purchase the same model.. As it turned out, 3 hours
after I bought my scanner, it crapped out.. I called him up, and he read off
the SN.. It turns out Radio Shack just threw the scanner back in the box, and
put it on the shelf.. Grrrr, another wasted trip was made out to RS...
After confronting the manager, they said that they were really sorry, and
that the cb was supposed to be shipped back for repairs.... Ahh well..
Everything I ever bought from Radio Shack crapped out within 2 weeks....

Just checked. It's there. Problem I have is this darn system I'm using
only allows kermit transfer protocols getting it from the mainframe
onto my PC. Scanm11.zip is 426,502 bytes. Using kermit, will take
forever, but when I have time I'll retrieve it.

Same here. The Los Angeles City Fire Dept operates almost entirely in
that frequency. For the ICOM R-7100-2 just to entirely delete the whole
800 mhz range out, makes no sense, especially since it's one of the
most expensive scanners (about $1350.00) out there. For that price,
you think they could do better. Better yet, try to work for a govt
agency, and use a govt purchase order to get the full-coverage R7100-1
instead. (Naturally, reimburse your employer for the scanner).

True. My usenet reader chokes every time I reply to a post that has
been posted to both groups, and I have to go back and edit out
alt.radio.scanner every time. It's just that old newsgroups sometimes
have an awful time trying to die.

No need to spend $1000.00. A couple of hundred dollars can get you some good hand-held models. check the Grove catalog (800)438-8155, or Radio Shack after you've done some research (like reading all the posts in this newsgroup).
As far as base models, I own a RS-2030 and RS-2006. My 2030 currently sits in the closet. It costed about $199.00. It is a good first scanner, especially if you can get an older model from a Radio Shack that is still modifiable. You can program 80 channels, scan most frequency ranges you're interested in, and search frequencies at 50 channels per second. The only problems I see with this scanner is it's double-conversion, and I've had some problems with frequencies appearing in the wrong place, causing reception difficulties in parts of some bands. But it isn't that bad. It is also a very light scanner, and probably weighs less than a pound. For a desk scanner, I had to hold it down while pressing the buttons.

The RS-2006 is a discontinued model. Some Radio Shacks may have some in stock. I heard that Grove Enterprises (800)438-8155 still had some new ones for $369, but were running out, so you have to act quick. This scanner has 400 channels, and all 2006s are easily modifiable (see below). You get 25-250, and 760-1300 mhz coverage, I can do many more things on it, than on the 2030, to help you listen to whatever you may come across. Some, like changing the mode your in, and channel spacing, you can only do on the 2006, and not on the 2030. It is also triple conversion, so there is hardly any image problem that I can see. It has a slower scan rate (26 channels per second) and this luminescent type of display that may wear out on you after extended use (it has a light on/off switch to save wear on the light). The light is replaceable, but it does involve some disassembly and a soldering iron. But all things considered the 2006 far exceeds the 2030. You shouldn't be disatisfied with it if you plan on scanning as one of your hobbies.

Modification to restore cellular frequencies in the Radio Shack PRO-2030
Scanner. Note: Newer PRO-2030s lack and L201 jumper/diode to cut.
It is unsure if these units are modifiable.
Modifications are done at your own risk. Current U.S. law makes it
illegal to listen to cellular frequencies, although it is unclear
if the law is being enforced, or is enforceable. It is currently
not illegal to own a full 800 mhz scanner, though, and the below is
given to restore this capability in which this scanner was orginally
designed for.

This mod is essentially the same as the PRO2026 except the location of the
jumper is slightly different.

1. Remove power cable.
2. Turn unit upside down.
3. Remove five (5) recessed screws from bottom panel.
4. Carefully remove bottom panel.
5. With display panel facing you, locate the jumper marked L201 on the
circuit board attached to the display. It will be about
2" in from the from and 2" in from the right side. It will look
like a RF coil.
6. Cut the jumper marked L201.
7. Reinstall the bottom and reconnect power. Scanner is ready for use.
8. Cellular frequencies are now restored with 30 Khz channel spacing.

Please note: I picked up this mod from the FIDO net. I have never
completed the mod myself because I own the 2006. But I do have the
service manual and this is the diode that locks out the cellular band.
Even the specs show this diode connected to pin 10 of the microprocessor.
This pin is the STRAP OPTION CELLULAR SKIP. Too easy!

^^^^^^
Whoops... I mean 25 - 520 and 760 - 1300 mhz coverage!
....Another typo....

P.S.: Stuff between 520 and 760 mhz is considered the upper UHF television
band. You really aren't missing much if you don't have it, and that
is why most all scanners don't have it.

From: rats@ihlpm.UUCP

PRO-2006 Modifications

NOTE: The Electronic Communications Privacy Act of 1986 makes it unlawful to monitor mobile telephones, including cellular. The following modification is intended only to restore continuous 760-1300 MHz coverage as originally provided by the design of the PRO-2006 microprocessor.

BE SURE TO TEST YOUR PRO-2006 FULLY BEFORE ATTEMPTING THIS MODIFICATION. ANY MODIFICATION MAY VOID YOUR WARRENTY.

824-851, 869-896 MHz Frequency Restoration

Tools Required: small Phillips screwdriver, small wire cutters.

Procedure: With the power cord unplugged, remove the two rear cabinet screws holding the upper cover. Lift off the upper cover, being careful not to stretch the speaker leads. Examine the inner, right-hand-corner of the front panel to find two glass diodes, labelled D503 (upper diode) and D502 (lower diode).

Using the clippers, very carefully snip the visible lead of the lower diode (D502) at its bend and slightly separate the cut ends. If it is ever necessary to send the radio back for warrenty repair, the diode leads should be carefully resoldered.

Reassemble, plug in AC cord, turn on scanner, and press RESET.

Keyboard Beep Delete

With the top cover removed as described above, locate connector CN3, a 15-pin connector with colored wires at the front of the main circuit board. There are two precedures which will stop the beep tone from being heard through the speaker; read both to decide which procedure you want to follow.

(1) Find the center grey wire coming from CN3 and cut it midway to disable the beep tone. You may wish to solder a resistor in series to reduce the beep volume, a trimpot to vary the volume of the beep tone, or a minature switch to choose between beep and no beep.

(or)

(2) Using a pair of needle-nose pliers, CAREFULLY pry the plug from CN3, revealing a row of pins. Locate the center pin (#8) which corresponds to the grey wire and bend it down flat, disabling the beep circuit. Reinsert the plug. The pin may be erected again later to restore the beep tone if desired.

This completes the restoration procedure. Reattach the cover and replace the screws.

WARRANTY REPAIR

Should it be necessary during the first year of ownership of your new PRO-2006 to exercise your warrenty, it should be carefully double-boxed (as you received it) and returned to Grove Enterprises. Be sure to include a copy of the original bill to establish warranty privileges.

You must prepay only shipping and insurance; return shipping and insurance to you will be paid by the dealer.

Grove Enterprises, P.O. Box 98, 140 Dogbranch Road
Brasstown, NC; 1-704-837-9200

|> Any side-effect? A guy from Marymac told me the mod
|> increases scanning speed significantly.
|> nvn

There are two diodes behind the "3" key on the keypad. Clipping one restores cellular, clipping the other increases scan speed by about 13%. I did this to my Pro-2006 after the warranty expired and did indeed measure a 13% scan and search speed increase. I don't think this has had any adverse effects on the radio although its theoretically possible that the increased scan speed might cause the radio to miss some carriers - but this is purly speculation on my part.

Cheers,
Peter

>CRYSTAL FASTER THAN 12 MHZ IN THE PRO-2006?

Yes, I have done the Crystal mod. I used a 16.630 MHz crystal from an old cordless phone (no bull), and I got a big speed increase (approx. 46 channels per second). I tried several different crystals, ranging from 16MHz to 39MHz, and my results seem to indicate that the highest crystal freq. should be about 18 MHz. If the crystal is too fast, the 2006 just uses the 3rd harmonic (ie a 39MHz crystal operates like a 13Mhz.)

From: ross@novax.llnl.gov

>The Scanner Mod Handbook #2 says to replace the 12 MHz crystal with something
>>faster; however, the author, Bill Cheek, says he hasn't actually tried it. I
>>haven't either, although I'd be interested in knowing if it is a successful
>>mod.
>

Well gang,right after I got my Mod handbook 2, I tore into my 2006. At first I tried a 20 MHz xtal, the processor locked up and not all the LCD display segments were happy (I had already done the diode clip speed mod). So I tried an 18 MHz xtal, same problems. I contacted Cheek (the author) and he reported that 16 MHz was the safe upper limit as he had seen no lockups at that speed and higher speeds had produced lockups on SOME units.

So I changed xtals again. The 16 MHz runs fine without any loss of sensitivity and I find enough delay left to still be able to use it (a faster microprocessor xtal shortens delay time).

My favorite 2006 mod is a wired remote control (Monitoring Times Aug 91 - Bill Cheek). I added a few extra parts and can control the following functions from six foot detachable cord: Scan, Manual, Search up, and Search down. Searching is a snap when you can't reach the keyboard or it is dark.

Gary

Subject: RE: PRO-2006 Scanning Speed Mod.

Well, I changed the crystal in my Pro34, which is the same type of crystal and harder to get to than the 2006; however, I haven't changed the 2006 crystal yet. Some of the following instructions come from the Scanner Mod Handbook Vol. 2 on removing the logic board. Please read it all before doing anything. If you royally screw up your scanner, IT IS NOT MY FAULT!!!!!

Before you start anything, make sure you are at a static safe workstation. Unplug the A/C power cord. Remove the top and bottom covers. Remove the 4 countersunk machine screws from thesides of the front panel, then gently pull the panel away from the main chassis. All wires and cables will have to be disconnected from the top and bottom of the logic board (the board that the crystal is on). This will cause your memory channels to be lost and you will have to reprogram them :-((If you can work around it, you could leave CN-3, a 15 wire connector, connected to save your memories). At this point you may have to desolder a ground wire from the chasses going to the bottom of the logic board metal shield. Next, remove 6 small screws that secure the logic board to the front panel. Then, face the inside of the front panel placed in an upright position and locate the white 13-pin connector (CN-501) at the upper left corner of the board. This connector doesn't have any wires, just metal pins going into it. Gently pry this connector apart with a small flat blade screwdriver and the board should slip away from the plastic front panel and come loose in your hand. Also, you may need to remove the volume and squelch knobs. Desolder the metal shield at six places around the logic board and lift it up and off the board. This is fairly easy to do with a low wattage soldering iron. Apply pressure with your fingers while the shield is heated at each leg. As the solder melts, that leg of the shield will slip upward and pop free. Now there are two choices. If you have an air sucking soldering iron, you can procede to desolder each of the three leads. If you have a normal iron, this will be impossible. The remaining choice is to crush the crystal with a pair of needle-nose pliars until only three leads remain sticking up off the board. Then you can heat and remove each of the three leads. The center lead is ground. You will only use the outer two leads when installing the new crystal. It would be a good idea to insulate the body of the crystal with shrink tubing (whatever you do, don't use electrical tape!) to avoid it shorting out to another component. The crystal will have to be bent over so that the metal shield can fit back on top of the logic board. Before you completely hook everything back together, get the scanner in a usable state and make sure it works. It would be a real bummer to tear it all apart because something is wrong.

Hope this helps,

David

Subject: Pro2005/6 SSB MOD HERE!
From: horak@convex.com (David Horak)
Date: Mon, 31 May 1993 18:04:59 GMT

I had a few requests for this mod so I thought everyone would benefit...

This is the mod for adding SSB capability to your Pro2005/2006. It is taken in part from Bill Cheek's Scanner Mod Handbook Volume 1. As long as you have a shortwave receiver with an external antenna jack and capability to tune to 455 KHz, you can interface it to the Pro2006 with this mod. It is best if you use a static safe work environment to perform this mod and you should have some technical knowledge. Also, a schematic would be helpful but is not necessary.

You will need the following parts:

Output jack (I use a 1/8 mini earphone jack but some like a BNC. The 1/8 mono jack is easier to install because you don't have to drill as big a hole in the back of the unit)

.01 uF capacitor

5 Kohm resistor (1/4 watt)

6 inches of mini coax or other shielded cable

A cable to run from the 2006 to your shortwave. I use the shielded cable that has the 1/8 plug on one end and a phono plug on the other end (1992 catalog Radio Shack P/N 42-2444 works for me). The phono plug is perfect for the antenna input of my DX440 shortwave receiver.

The first step is to remove the cover of the unit and drill a hole in the back of the 2006 for your 1/8 or BNC plug. (You will want to wrap some tape around the drill bit about an inch from the end to keep it from cruising right on into the electronics once it punches through the metal!) Solder the 5K resister to one end of the .01 uF cap. Solder the other end of the cap to the shielded coax wire. Solder the other end of the coax to your 1/8 phono plug (or BNC) and ground the cable at this end. Now that the cable is in place you are ready to connect it to the 455 KHz source which is D33. It is on the top circuit board near the middle left, not too far from a huge capacitor. Solder the end of the resistor to the cathode of D33. (This should be the top of the standup part) Now you can test it out before you put the cover back on to make sure you did everything correct. You should be able to tune to some local airport or CB frequency on your 2006 and receive the same thing on your shortwave (with it tuned to 455 KHz and hooked up to the 2006 of course). If you tune something on your scanner that is SSB, you should be able to switch your shortwave to SSB and tune in the signal just fine. Beware of one thing, since the 2005/6 only tunes in 5 KHz increments minimum, you may notice from time to time that the signal on your shortwave isn't real clear. It may be that you will need to tune the shortwave anywhere from 451 to 459 KHz to tune in the signal well!

If you don't succeed or this description has you baffled you probably shouldn't be doing the mod in the first place. I assume no responsibility for screwups. Good luck

David

Hi,

My shareware program, Radio Manager for Windows, controls the Icom R7000,
7100, 9000, etc, and now the Pro-2006 with the OptoScan456.

The program is available as RM.ZIP at the following places...
CompuServe's HamNet Scanning Library
America Online's Ham Radio Area's Software Exchange (30Mhz and Up)
ftp oak.oaklnad.edu /pub/hamradio/pc/ham-utils

Send me email if you would like more detailed information.

Anyone seen any reviews and/or own a Radio Shack PRO-2035, which is their new 1000 channel base scanner, that probably isn't cellular modifiable, and costs $450.00

Are the reviews bad/good? Does anyone like it/hate it?

Tucked away at the end of the Digital Telephony Bill passed last night by Congress is a provision making monitoring of cordless telephone frequencies illegal, the same as celluar freqs.

Any bets on how long it will take for the FCC to require manufacturers to block off another chunk of non-restorable RF spectrum? Get ready to check for "B" suffixes on those ID numbers!

3504. Service symbols?

Newsgroup: rec.radio.scanner

3505. Monitoring 520-760 on PRO-2006

Newsgroup: rec.radio.scanner
Date: 1994-10-09 02:15:08 UTC
From: shawn4sk1@aol.com
Message-ID: <377jnc$1so@newsbf01.news.aol.com>
Source record: 267563

I found this today and was wondering if it would be a _successful_
solution for being able to hear the normally missing 520-760 freqs on a
Pro-2006:

"Image reception is usually an undesired function of a receiver but it
some
cases is useful. Images are common in scanners because their receiver
front ends are not very selective.

To calculate an image frequency you need a couple of pieces of
information.
Mainly, the frequency you want to receive and the first intermediate
frequency
of your scanner. Multiply the IF by two and add or subtract that number
to/from the frequency you wish to hear. If the result is a frequency you
can
program into your scanner, use it. Here's an example used to listen to
aircraft.

My scanner is not designed to be air band programable.
I want to hear 135.4 MHz.
The first IF of my receiver (in the specs) is 10.7 MHz.

2 x 10.7 = 21.4
21.4 + 135.4 = 156.8
135.4 - 21.4 = 114.0 (won't work in my receiver)

I program 156.8 into the scanner and I should be able to hear air traffic
on
135.4. Of course, I also will hear a whoever is using 156.8.

Of course, your scanner must be able to receive AM on 156.8, which
would be a little unusual. Aircraft radios from 118-135.975 use AM in
the US. Most scanners that don't receive aircraft don't have an "AM"
position and aren't able to detect AM signals."

Next question: it says we'ld need to know "the first intermediate
frequency
of your scanner". Can someone clarify what that would be on the 2006?

Thanks In Advance! :-)

118.100 Unknown Use
118.200 Unknown Use
121.900 Ground Support (refueling)
123.400 Blue Angels - Common Control (?)
141.560 Blue Angels - Maintenance Charlie
142.000 Blue Angels - Maintenance Alpha (AM) - Repeats an Air-to-Air
Channel
142.025 Blue Angels - Maintenance Delta (Repeated on 142.625)
142.260 Unknown Use
142.265 Unknown Use
142.625 Blue Angels - Maintenance Delta (Repeats 142.025)
143.000 Blue Angels - Maintenance Bravo (AM) - Repeats an Air-to-Air
Channel
143.600 Blue Angels - Maintenance (Channel 10 ?)
241.400 Blue Angels - Air-to-Air
245.900 Blue Angels - Air-to-Air
246.400 Blue Angels - Air-to-Air (Soloists ?)
250.800 Blue Angels - Air-to-Air
251.600 * Blue Angels - Aircraft 5 and 6 - The "Soloists" [Preset 8]
251.800 Blue Angels - Aircraft 5 and 6 (?) [Preset 19]
263.350 * Blue Angels - Flight Line Common (Aircraft Maintenance)
263.500 Blue Angels - Air-to-Air
275.350 * Blue Angels - Aircraft 1-4 (The "Diamond")
302.100 Blue Angels - Talkback (?)
302.150 * Blue Angels - All 6 Aircraft [Preset 17]
307.700 * Blue Angels - All 6 Aircraft (Alternate) [Preset 16]
318.900 Blue Angels - Air-to-Air
345.900 Blue Angels - Air-to-Air
348.600 Ground Support (?)

360.400 Blue Angels - Soloists (?)
362.600 Air Show Control (?)
363.350 Possibly a typo on one list of 263.350 (?)
363.500 Possibly a type on one list of 263.500 (?)
382.500 Blue Angels - Air-to-Air
384.400 Blue Angels - Air-to-Air
391.100 Blue Angels - Air-to-Air
391.900 Blue Angels - Air-to-Air
395.500 Blue Angels - Air-to-Air
395.900 Blue Angels - Air-to-Air

* = Heard in San Diego at Blue Angel shows - Confirmed.

251.600 is Aircraft 5/6, the Soloists
263.350 is Flightline Maintenance - "My Plane's Broke, FIX it!"
275.350 is Aircraft 1-4, the Diamond Formation
302.150 is All Aircraft (Used at Friday Show)
307.700 is All Aircraft (alternate - used only in practice this year)

Both 307.700 and 302.150 were used at different times during practice this week - either might be used in the actual shows, or both might.

Note that not all frequencies are used at every airshow, there are a lot of "alternate" channels, to avoid local users on a given channel. Also, during practice, channel usage does NOT conform to actual airshow usage - for instance, 263.350 may be used as air to air, instead of just for calling the mechs on the ground to request repairs on landing.

Don't count on usage listings above - things change, or may have been incorrectly reported.

3510. Questions about Pro 43 and Pro 51

Newsgroup: rec.radio.scanner

Message-ID: <pgunn.274.781688721@alkali.otago.ac.nz>
Source record: 267567

I've a mate that is looking to buy one of these in the medium term. I'd be indebted if someone could give me the details on the '43 and the '51.

What bands do they cover? What modulation in those bands? (always AM or NFM or choose like my Yupiteru MVT-7000)? How many memories? Which '43s can be modded for Cell?

Thanx in advance.

Happy Scanning

You might also want to check and see if there is a local Sky Warn group in your area. If there is, they may have a data feed in the 2 meter band.

Here in Chicago, our skywarn group transmits the entire NOAA Weather Wire on 147.060 MhZ at 300 baud 8/n/1. Other groups may use RTTY or packet.

3513. Monitoring SF Fleet Week Show

Newsgroup: rec.radio.scanner
Date: 1994-10-09 14:59:26 UTC
From: jpotts@crl.com
Message-ID: <3790ge$bmd@nntp.crl.com>
Source record: 267572

I found the following frequencies active during the show on saturday.

Airshow control 134.100MHz AM
Blue Angels solo 251.600MHz AM
Blue Angels Formation 275.350MHz AM (a little more act on next)
Blue Angels Formation 307.700MHz AM (most active for formation)
& join up.

Alameda NAS 384.400MHz AM & 127.050MHz AM

USCG vessel traffic for the fleet 156.700MHz
USCG Tactical control 157.175MHz (very active)
USCG coordination 156.300MHz

NPS Rangers 164.800MHz
NPS Police 163.150MHz

I hope this helps your enjoyment of the show.

Hi Eric,

Maybe rec.radio.shortwave may be a better group to try ??

I think you'll find that they transmit on several frequencies
depending on time of day, time of year, time in sunspot cycle
and target coverage area.

Sorry to be so vague.

Regards.

MAX.

it's a pretty trivial matter to replace the medium bandwidth filter
in the R7xxx receivers with one that is 30KHz wide. This will give
pretty good results on APT satellites from my experience.

On the other hand it is a lot cheaper to buy a cheap scanner
and do the same thing: and you have a dedicated setup which
is much nicer than having to swap antennas to use yhour r7xxx
for the other purposes it performs so well at.

I was in Japan last week and stopped in Akihabara to check out
radios. I discovered the R7100s offered for sale cleverly delete
only the cellular frequencies, retaining the other 800mhz freqs.

However the sales dox indicate they stop coverage at 1000mhz and
pick up again at 1300mhz. I did not notice this behavior when I
twiddled the dial.

After I walked away, I remembered that I wanted to check to see if
the Japanese model deleted the 3xxmhz Japan cordless frequencies,
but it was too late in the day for me to go back to check. Next
time perhaps!

One last thing: I did find a few of the original full coverages
ones there for sale, $1150 was the asking price.

Too bad I was not confident I would clear customs with them. Otherwise
it would have been damn tempting......

What the (dis?) Honorable Mr. Levin did not tell you is that such fraud
is already illegal. There are numerous Federal and State statutes which
already codify theft of service, wire fraud etc. We do not need another
law on the books which codifies acts already illegal. Vote this schmuck
out of office in November!

So, the Digital Wiretap Act outlawed the monitoring of Cordless Phone Calls? Same as Cellular Now? Or, what?

SEC. 202. CORDLESS TELEPHONES.
(a) Definitions.--Section 2510 of title 18, United States Code, is amended--
(1) in paragraph (1), by striking ", but such term does not include" and all that follows through "base unit"; and
(2) in paragraph (12), by striking subparagraph (A) and redesignating subparagraphs (B), (C), and (D) as subparagraphs (A), (B), and (C), respectively.
(b) Penalty.--Section 2511 of title 18, United States Code, is amended--
(1) in subsection (4)(b)(i) by inserting "a cordless telephone communication that is transmitted between the cordless telephone handset and the base unit," after "cellular telephone communication,"; and
(2) in subsection (4)(b)(ii) by inserting "a cordless telephone communication that is transmitted between the cordless telephone handset and the base unit," after "cellular telephone communication,".

What he also did not tell yo is that the purpose of the RICO statutes
was not to block anti-abortionists from blocking abortion clinics, but
that is what the law is now being used for. Again intent and wording are
different. We do not need this clause in the Digital Wiretap law, get rid
of it and the sponsors and those that support this legislation.

ok netters, here it is about a month away from the mid term elections
and a damn good time to review who has been supporting legislation
that is attacking our hobby.

I propose that we make a state by state list of those that are our
enemies and that we post that list right here so we all know who
we do not want to vote for.

If anyone would like to gather names up and email to me I will be hap[py
to compile what is sent and post it for all of us to see.

Our fine representitive Don Edwards who is a co-author of the Digital
Wiretap bill is retiring, so we have already disposed of this worthless
piece of trash. Now it is time to put a list together of those that
suported and voted for the Digital Wiretap bill.

I just returned to the US from a two week trip overseas and believe
I heard that the Digital Wiretap bill passed the Senate. Is this
correct? If so can someone send me a pointer to the list of how
the votes were cast?

...Who the heck knows. Probably coming next are regulations from the
FCC prohibiting 'Cordless Telephone Capable Scanners'. They'll soon
be so many holes in a scanner's capabilities, that they won't be worth
buying anymore. But with images found on less-expensive scanners, you
for sure will find cordless telephone calls even on crippled scanners.
A totally unenforceable law, to prevent public snooping, brought to you
by the biggest snoopers out there: The U.S. Government, who want
things like clipper encoding, allowing them the only entity to hear
scrambled transmissions. All in the name in National security, or
preventing drug trafficking. (Don't believe that, either).
But I wish I knew what else is coming. Probably some law outlawing
listening to dogs barking at one another, because their conversations
are somehow encoded, and dog barking thus should be considered
private communications.

arf, arf.. (I'm not telling you what I just said.)

3523. Re: Pro-43 Mod. - Success!!!

: Well, finally got up enough nerve last night to try the cellular mod
: on my Pro-43.

: Everything went good until I actually saw the size of the diode I had
: to remove---WOW are they ever small!!

: With fingers crossed, I managed to remove the diode with no serious
: side effects to the scanner (I won't mention the little accident
: involving the soldiering iron and my pinky finger).

: The moral of this story is - if -I- can do this (being
: electronically challenged as I am), then anyone can - it's not really that
: hard!!!!

Well I did the same thing. After taking my Pro 43 to several shops to
get modified (at prices rangeing from $64 - $122 per hour (one hour
minimum)) I decided to have a go myself.

It cost me $24.00 to buy a soldering iorn, solder, some screwdrivers and
a solder sucker, and I got a book out of the libary on how to solder.

Well I opened up the case and took out the 8 screws and the plate no problem
but the size of those diodes WOW!! They seem to have shrunk a lot since I last
saw one in 1977 :).

Well I used a pair of tweezers to lift the diode off the board and
managed to get it back into the the slot next too it. The end result is
fantastic :)). Every thing works just dandy.

The moral of this story is if I can do it then anyone can.

3525. pro43 vs bearcat 200xlt

Newsgroup: rec.radio.scanner
Date: 1994-10-09 20:04:35 UTC
From: BRUCE@BUMETA.BU.EDU
Message-ID: <379icj$qpv@news.bu.edu>
Source record: 267483

I'm new to scanning and am interested in buying a handheld
scanner. Either the pro43 or bearcat 200xlt seem to meet my needs
(200 channels, 800 mhz - but not necessarily cellular etc) but
at approx $100 difference in price I wonder if the pro43 is really
much better than the bearcat. Are there any other scanners I should
be considering? Does anyone know of any published reviews of
handheld scanners? Also I see some used bearcat 200's advertised
locally, is there a difference between the 200 and the 200xlt?
Any other comments would be appreciated.

>Thanks, Usman

When I lst ttok an American flight the stewardess pitched a fit cause I
was listening to my scanner, she said that no airlines allowed scanner
use on aircraft, so I showed her my copy of the Delta policy. She
still insisted that I turn off scanner, so I did. But hey, give it a
try!

You are right. The listening to cordless telphones on your scanner will
be illegal just as soon as Billary signs the law (S.2375/H.R.4922).

The Senate did not leave any fingerprints on this on. They passed it on a
voice vote after the deal was worked out in the back room.

3529. Re: Calif. Cellular Telephone Law - Retailer Rip-Offs

>After reading, and thinking, about this, I will be writing the Calif.
>Atty General's Office, Telemarketing Unit, 300 S Spring St. 5th Floor,
>Los Angeles, CA 90013, about my experiences being lied to/ripped-off
>by these firms. I would also like to see some local televisions news
>stations shop theses stores, to show how these retailers just thumb
>their noses at the law. I would suggest all those reading this, to do
>the same also.

I spoke with an analyst at the California Attorney General's Office --
he said the imposition of the requirement that the cellular telephones
be programmed before leaving the store is indeed a violation of Calif.
Business & Professions Code 17026.1 that explicitly forbids a store to
require "activation ... by any cellular provider" -- this requirement
is legally the same thing as requiring activation. Moreover, charging
a fee for programming the phone where no additional fee was explicitly
mentioned in the advertisement violates state and federal laws which
forbid false/deceptive/misleading advertising because the advertisement
explicitly says the price of the phone is $69.00 (maybe $94.00 if there
is an actual rebate [not just an application fee waiver]) -- yet when
you try to buy the phone store personnel try to charge $100 more than
the advertised price. Finally, as noted earlier in this subject string
store employees are told by some firms to lie about phones being out of
stock if a customer even hints he doesn't want activation.

All of these business practices fall under the general category of what
the state calls unfair business practices because they attempt to get
the public into the store by offering bargain basement pricing on the
phones -- but when you get into the store the price is suddenly double
or even more than double the advertised price. These business practices
are dishonest -- and the people who are responsible for directing other
store personnel to participate in deceiving the public should serve some
significant time in jail (six months for each documented deception) and
pay some huge fines for violating state and federal law concerning cell
telephone sales.

If you or your friends have ever tried to buy a cellular telephone which
was advertised in the media or marked in the store at a bargain price --
and store personnel claimed the phone was not in stock or imposed a fee
(programming fee, deprogramming fee, contract termination fee, etc) - or
if the store required programming (the same thing as requiring activation)
then write to the address provided by the Attorney General's Office:

Office of the Attorney General
Public Inquiries Unit

Sacramento, CA 94244-2550

Describe the date, place, salesman, advertisement, marked price, additional fees and/or claim that the phone was out of stock as accurately as possible. Indicate that you have heard via the network similar practices seem to be rampant among several big Los Angeles cellular telephone sales organizations (Affordable Portables, Adrays, and other vendors have been mentioned here) -- and ask that investigators be assigned to (1) walk into the store asking to buy some advertised bargain basement cellular phone without activation -- to be followed by (2) another team trying to buy the same phone w/activation.

These people belong in jail. They are knowingly violating state and federal law. The most severe sanctions (fines & jail terms) should be imposed. The investigators might even be able to take in the management or owners of the stores under criminal conspiracy statutes. The stores may even be forfeited (taken over by the government) under the organized crime & racketeering laws.

It is one thing for a single salesman unabetted by his management to lie to & deceive the public. It is something else again for senior management & owners to promote a highly organized routine practice of deceiving the public. I say we should assess the highest possible fines, put them in jail, and confiscate any stores/personal assets which were obtained in part by deceiving the public.

3530. Notre Dame Freq?

Good old Benedict Edwards! What kind of political pressure is
applied to someone that is not seeking reelection and intends to
retire? Is it a matter of financial pressure? He retired on friday with
one last stab-in-the-back to the taxpayers. Of course, we as taxpayers
must fund this self-back-stabbing because it is now the Law. Perhaps some
future, enlightened (hahahaha) session of Congress can rescind his
pension or benefits.

Why won't the American Radio Relay League get their collective heads out of the sand and try fighting stupid legislation for once??? Just because these bills don't immediately affect amateur radio right now doesn't mean that precedents may be set for affecting it later on.

They're about the only group out there with the clout or ability to fight or change stupid legislation like this, but keeping their 'hams only' attitude isn't going to help when that's all there is to listen to in the future.

Most scanners are modifyable no matter what!
And if it is not modifiable at all then that product will not sell
since AOR products can be altered easily!
The AR1500 has wide coverage .5Mhz to 1300Mhz.
Well all of you on the net will find quality full coverage
scanners no matte what the laws are.

When I bought my AOR AR1500 there were not any laws restricting such
recievers. I picked it up for WEFAX satellite reception. PLus I picked
up a downconverter for 1.6Ghz.

It's getting pretty scary that our lives are becoming more and more censored.

Man,
My first job after college was as an engineer at Lincoln Lab with the LASER Group! Lasers are easily "absorbed". They use a frequency of light that is easily absorbed with g.$a#*)(@@@@ , I don't want to get into trouble. Also LASER RADAR can be jammed just like Microwave RADAR! You transmit the calibration signal!

NOW AS FAR AS CANCER GOES.... TALK TO ANY SEASONED HAM! even 73cm is harmfull with handhelds! if 440Mhz causes cancer imagin what a flip phone does at 820Mhz!

Rhode Island and Conneticut State Police did a study and the cancer rate is alarming!

the circuitry used to drive the LASER DOPPLER RADAR is also hazardous though, the LASER is pulsed at @1Ghz!

I suggest you read up on bio physics!
all matter, including our cell structure is bipolar.
that's why gravity has an effect on our body

It's been found that if the magnetic field gets stimulated while our cells divide.... well the DNA code can get mangled the cell forms a mass.. it forgets to die after it split 50 times

Thats why children who live near high power lines or well...
you draw the conclusion... birth defects al that stuff

I don't know about you but I wouldn't want a 250Watt RADAR sitting on my lap

and yep that's how some cops used it for speed!

laster isghLASEW blocked

3543. Beg. Q on double/triple conversion

This is being posted for a friend. I can answer as many questions as
I know the answers for, via E-mail.

For Sale

K-Band Radar *GUN* unit.

Operates on 24Ghz
(Some may be tempted to alter the radio to work in the ham-band, this
is why this has been cross posted to .homebrew and .equipment)
Runs off 12VDC (Comes with 12VDC Cigarette Lighter Plug)

This has been advertised on various newsgroups before, but the seller
lost their net access along with all prospective purchasers.

(2 or 3 were interested and bidding)

Their addresses have been lost along with the mailbox of the account
which was nuked.

If you are interested, simply reply here. I'm helping my friend sell
this unit.

*** Possible Items for Trade or Trade w/Cash ***

-Mobile scanner with 46mhz, VHF, UHF, 800 including Cel Tel, Etc.
-Dual Band 2m/440 Mobile radio with detachable faceplate.

*** Asking Price ***

$250 Cash (Repair shop lists this unit at $500)

Purchaser pays all s&h, No COD's.
^
^- Thus purchaser chooses options of shipper, insurance, etc.

"I've used this unit various times to clock different targets. It has
come in very handy for a friend who was clocking his high performace
car at the track. "

(You could acctually clock cars at a race with this if you bought an
easy to carry 12vdc power source)

*** All interested replies ***

Direct your replies to me via e-mail at:

br260@po.cwru.edu

If you have problems with the above address, you can send mail to:

root@b63062.cwru.edu (ONLY if the above address does not work)

If sending mail to the root address, make the subject of your
mail state: Pass this on to the old 'jbourne'

Thanks!

: Microwave RADAR! You transmit the calibration signal!

It can be absorbed - at least most of it can - if you are willing to
paint the complete front end of your automobile with the proper substance.
Windshields will also, in many cases, return a sufficiently strong signal.

If they have a calibration signal. If they are using T and D radar, then
there is no such signal. Even if there was, the officer would know what
was happening, just as they know with current radar. Such jamming happens
to be highly illegal, for a number of reasons, and is likely to get you
into far more trouble than a simple speeding ticket.

: NOW AS FAR AS CANCER GOES.... TALK TO ANY SEASONED HAM! even 73cm is
: harmfull with handhelds! if 440Mhz causes cancer imagin what a flip
: phone does at 820Mhz!

All we have is rumor, and some very uncontrolled studies. I don't
know of any Hams who have quit using handhelds because of a reputed
cancer risk.

: Rhode Island and Conneticut State Police did a study and the cancer
: rate is alarming!

If I recall correctly, the studies were uncontrolled. However, I would
like to see followup studies with other police groups - done properly.
I would also like to see another study done on the RI and Conneticut
Police.

: the circuitry used to drive the LASER DOPPLER RADAR is also hazardous
: though, the LASER is pulsed at @1Ghz!

I understood that they were not using doppler radar - but T and D
radar - fully accurate enough, and much less expensive.

: I suggest you read up on bio physics!
: all matter, including our cell structure is bipolar.

What does this mean?

: that's why gravity has an effect on our body

: It's been found that if the magnetic field gets stimulated
: while our cells divide.... well the DNA code can get mangled
: the cell forms a mass.. it forgets to die after it split 50 times

What magnetic field? Is there a counter in each cell that tells it
how many times it divides? I understood was that the DNA caused it
to split frequently, instead of at the normal rate.

: Thats why children who live near high power lines or well...
: you draw the conclusion... birth defects al that stuff

The power line studies are in some dispute. For example, the energy
fields from your vacuum cleaner and electric blanket are stronger than
at normal distances of a house from power lines.

: I don't know about you but I wouldn't want a 250Watt RADAR sitting on my lap
:
: and yep that's how some cops used it for speed!

How did they do this? All the ones I have seen had the transmitter in the
head - which was aimed at the automobile. Kind of hard to do that if you
are holding it in your lap. The readout unit may have been held in their
laps, however - and they may have contained a high voltage power supply.

At one time they had LAGRE selection of USED radar equipment.

X Band $200-600
K Band $500-900

Additional option is to look at the Ramsey Electronics "Personal Speed Radar Kit." Kit is ~ $60-80, and requires 2 large java cans for the antenna. Uses 2 GHz range. Unless EXTEREME ACCURACY is a must, this may be the most cost effective, taking that you can assemble a electronics kit. I can not vouch for its operation as I have not used it, just know its available.

Actually, you add _or_ subtract depending on the design of your receiver.

> ... need to know "the first intermediate frequency of your scanner".
> Can someone clarify what that would be on the 2006?

The PRO-2006 is a triple-conversion receiver and has a more complex I.F.
structure. The 1st L.O. tunes to the upper side and produces a 1st I.F. range
of 611.500-607.505. A rough approximation (+/- 4 MHz) would be:
Image freq = Displayed freq + 1219
i.e. the range of 'possible' images is 1250-2500 MHz. Since almost all of this
would be blocked by the bandpass filters, the PRO-2006 has very little problem
with images.

Hmmm ... I.F.'s and images must be popular on AOL lately.

Andrew Heliax works for me, as do any of the various .5" hardlines available.
This is essential stuff for playing with long distance runs or frequencies
over 400Mhz. Using this stuff I've picked up 800Mhz activity from as far away
as Washington, DC. which is approximately 200 miles from here. :)

One can even get this coax for free by visiting ones local cable TV provider.
Ask them if they have any leftover chunks from the giant spools they use. Ive
gotten some nice sections (as much as 100feet) this way. The connectors for
Heliax are, however, more valuable than gold.

> much better than the bearcat

Well, after several years out of the market, I'm looking too. What I've noticed, and is rather impressive, is that the pro43 is a triple conversion receiver. What this generally means is that image rejection should be much better. If you live in a smaller city or town, the pro43 could be a waste of money. But if you're like me and live in a place like Dallas, where RF creeps all over, then triple conversion could be a blessing, especially at 800MHz.

Also check out the Radio Shack pro39. It currently has a sale price of $219. The Pro43 is on sale now for $299.

By the way, I believe both of these models are made for Radio Shack by Uniden.

3557. Re: Beg. Q on double/triple conversion

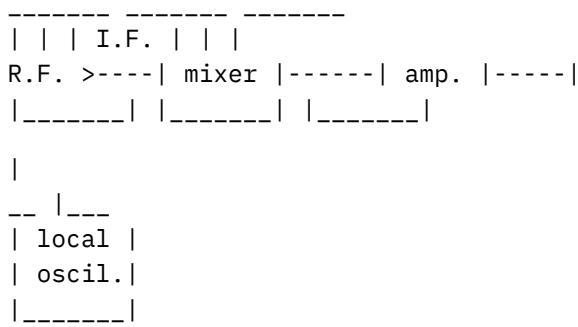
Newsgroup: rec.radio.scanner
Date: 1994-10-10 11:22:42 UTC
From: mulligan@ACM.ORG
Message-ID: <37b862$ecm@hopper.acm.org>
Source record: 267511

browere@einstein.cs.ucdavis.edu (Eric B.) asked:
> ... explain the concepts of double/triple conversion.

Well .... for a real quick overview (with 90% of the good stuff omitted) -

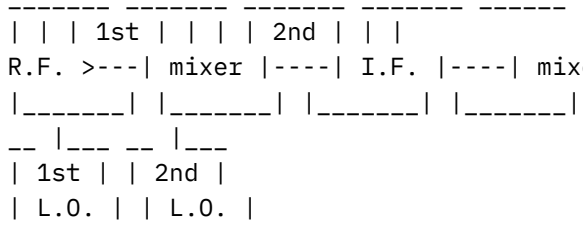
Early receivers required that you tune each amplifier stage to the incoming signal, then detect the audio directly from the received radio frequency. This meant tricky tuning and a lot of unwanted signals. The super-hetrodyne idea allowed the receiver to convert a selected frequency to a fixed intermediate frequency (I.F.), which could be amplified and filtered with no additional tuning (all I.F. stages are prealigned).

The conversion is accomplished by mixing the incoming signal(s) with a local oscillator (L.O.) signal. One of the products of this mixing is a signal at a frequency equal to the difference between the incoming and the L.O., containing all the original information.



Of all the frequencies present at the input, only one will produce the desired I.F. when mixed with the L.O. By tuning the L.O. you can select a particular R.F. whose result will pass the filters in the I.F. stages. For example, if your I.F. is 10.7 MHz and you wish to receive 105.9 MHz, you would tune the L.O. to 95.2. The difference is 10.7 and will pass through the I.F. stages; any other input freq. will produce some other difference and will be filtered out.
(Note: the preceding contains a major fib, to be explained momentarily.)

For normal broadcast signals this is sufficient. Scanners, however, have to cover a wide range and deal with closely spaced frequencies. To improve selectivity and filtering, two stages of conversion can be used -



```
|_______| |_______|
(tunable) 10.245MHz
```

The fib mentioned above is that there are two frequencies that will mix with the L.O. to produce the same intermediate frequency. If the L.O. is 10.7 MHz below freq. 'X', then it is also 10.7 MHz above freq. 'Y'. If there is a signal at freq. 'Y', it will mix with the L.O. and produce the correct I.F. In the example above, a signal at 84.5 MHz would come through if it is not filtered out in the R.F. stage. Scanners have to accept a wide range and the "image" signal slips through. (Note that receivers may use other I.F.s and the L.O. may be tuned above the desired signal, rather than below.)

True triple conversion receivers attack this problem by adding another L.O., mixer and I.F. The first I.F. is quite high (around 610 MHz for the PRO-2006 and PRO-43), producing image freqs beyond the high end of the receiver and easily blocked. With judicious choice of 1st and 2nd I.F.s, and careful filtering, the result is a clean, sharply tuned signal with no images and little or no 'intermod' (interference from multiple adjacent signals).
A few scanners claim triple conversion, but actually just shift high freqs down en-mass (block conversion) and let the second stage sort them out.

As to whether triple-conversion is worth the price, it depends on budget, location, R.F. environment and features. The true triple conversion scanner probably has better design and circuitry, since they put more work into it and can spend more in production (which you pay for). If you're in a noisy R.F. environment, it's probably worth it.

I think the portable cellular phones are only .6 Watts, right? The
true mobiles are 3 Watts. Not that it doesn't deserve consideration.

>All we have is rumor, and some very uncontrolled studies. I don't
>know of any Hams who have quit using handhelds because of a reputed
>cancer risk.

I agree with the "very uncontrolled studies" comment. I've often wondered
about the validity of ANY cancer studies on amateur radio operators.

What's our average age anyway? Older people usually DO have a higher
cancer rate compared to the average population.

I've also noticed a sedentary lifestyle for the majority of the amateur
population around here. Much easier to "sit in the shack" (say that three
times real fast ;-) doing DX year after year rather than keeping the old
cardiovascular system in shape. If we DO get out of the shack, it's for
coffee and donuts! ;-) There is field day of course. That once-a-year
exercise. While I've only been invloved for about 2-years now, I've
experienced the decrease in physical activity myself.

Not that there shouldn't be more studies. RF/EMF can be a very dangerous
thing.

Message-ID: <CxGGxJ.Jx@nntpa.cb.att.com>
Source record: 267512
Cross-posted to: rec.radio.scanner,alt.radio.scanner

Has anyone else noticed a blocking gain compression problem
on the new 1000 channel PRO-2035 as compared with the PRO-2006?

For example, a strong signal on 460.525 MHz can produce white
noise on weaker signals up to 100 kHz away on the unit I'm evaluating.
Blocking performance in the 155 MHz range appears similar.

: elec. co.).
: 2) is on top of house about 50 feet. Is over 100 feet to far to run
: cable or : is shorter the better?

Depends on the frequencies you'll be listening to. RG-8 is about 1.3db loss per 100 feet at 30 MHz where RG-8/U Foam Dialectric is only .9 db loss per 100 feet there. RG-58 is a little more than 2.5 db loss per 100 feet at 30 MHz.

If you are using frequencies above 100 MHz you're talking 2.5 db loss per 100 feet with RG-8 and more than 3 db at 2 meters. RG-8/U is about 1.8 db loss per 100 feet at 2 meters and short of hardline I usually recommend Belden 9913 which comes in at about 1.4 db loss/100ft.

For short runs pretty much anything goes. For more information I would recommend the ARRL Handbook. I use it as a guide. There's too much to consider to put it all down here.

Hope this helps.

Jim / WK1V

>What does this mean?

It means cells are affected by electric fields, same way a bar magnet will align with an external magnetic field. It's the principle behind electrophoresis. During cell division, while the nucleus is splitting, the cell is particularly vulnerable to electric fields. As far as I know, magnetic fields aren't implicated in this at all.

>: that's why gravity has an effect on our body

Of course this is nonsense.

Apparently there *is* a form of counter in the cell. Cell death is programned in, otherwise we'd all live forever. What exactly that mechanism is, is still under intense research. We do know that cancer cells don't have it, and so proliferate indefinitely. Some cancer tissues have been kept alive in vitro for decades with no signs of aging.

>: I don't know about you but I wouldn't want a 250Watt RADAR sitting on my lap

Well, obviously, the handheld radar guns used by police are *not* 250 watts. They are in fact in the range of 10 *milliwatts* to 25 *milliwatts*. However, cops are in the habit of resting the guns in their laps when they

aren't actively clocking a vehicle, and they *don't turn them off* for the entire shift. So they get a good near field dose to the testicles. Testicular cancer rates are higher among police who do traffic patrol. Figure what the power density is right at the mouth of a 17 db standard horn and you'll see the levels they are getting are above ANSI limits. This is also why you should never look into the antenna of a microwave transmitter, no matter if it is very low power. The ERP can still be above safety limits at very close range.

This is a fairly old radio now. I think the low end is like 60 or 90 MHz so
you miss some of the low end action. There are also very few known mods, or
software packages to control this radio. I would only buy this is the price
was very good (although I don't know how much that would be), or if you have
at least one other scanner already.

3564. Pro46 audio

Newsgroup: rec.radio.scanner
Date: 1994-10-10 12:33:35 UTC
From: allan@vicorp.com
Message-ID: <37bcav$dmb@xeno.vicorp.com>
Source record: 267516

I bought my mom a Pro46 last Christmas. She called last night to tell
me that the audio is dead. She can only hear it at a normal volume
if she turns up the volume all the way.
I would like to know if this is a common problem and if it is easy to fix.
Mom is afraid that if she takes it in for repair it might come back
not being able to pick up some of the frequencies it can now.
We know it's not the speaker, she uses an external speaker. Both the
internal an external speaker can't be heard.
Please help, if I don't get this fixed for her soon she may
go back to watching TV.
thanks.

3565. [Q] PRO39 or PRO43 (NEWBIE NEEDS HELP)

Newsgroup: rec.radio.scanner
Date: 1994-10-10 12:36:41 UTC
From: magarro@bbs.ug.eds.com
Message-ID: <1994Oct10.123641@bbs.ug.eds.com>
Source record: 267442

Hello

I a newbie in the scanner world. I havenUt been reading this newsgroup so excuse me if I am asking a question that has been debated and answered to death. I have been looking at two Radio Shack scanners, PRO 39 and PRO 43. My local store has them on sale at $219 and $299 respectively. Is it worth the extra $80 to get the PRO 43? What makes it worth $80?

I have also heard that Radio Shack has modified there scanners so that an out of the box scanner isnUt able to pick up some of the 800Mhz frequencies. However, I also heard that some of the PRO39 and PRO 43 scanners are modifiable so that the blocked 800Mhz frequencies can be received. Then a co-worker of mine mentioned that Radio Shack is currently selling some PRO39 and PRO43 scanners that are UNMODIFIABLE. He went on and mentioned that an A, and C after the FCC id # on the PRO39 and PRO43 respectively determined whether they are UNMODIFIABLE.

I have also heard that Radio Shack has modified there scanners so that an out of the box scanner isnUt able to pick up some of the 800Mhz frequencies. However, I also heard that some of the PRO39 and PRO 43 scanners are modifiable so that the blocked 800Mhz frequencies can be received. Then a co-worker of mine mentioned that Radio Shack is currently selling some PRO39 and PRO43 scanners that are UNMODIFIABLE. He went on and mentioned that an A, and C after the FCC id # on the PRO39 and PRO43 respectively determined whether they are UNMODIFIABLE.

Any help would be greatly appreciated from this radio scanner newbie

Thanks
Richard

3566. Re: Cordless phone scanning banned

Newsgroup: rec.radio.scanner
Date: 1994-10-10 13:11:36 UTC
From: ad225@detroit.freenet.org
Message-ID: <37bei8$521@detroit.freenet.org>
Source record: 267518

Anyone speaking on any radio device should always asume the
conversation is being monitored. Legislation just gives the
users of cordless phones and cellular phones a false sense
of security.

An acquaintance of mine recently fired up his scanner and
picked up a conversation by a neighbor who was selling
drugs out of his home. He began listening to the conversations
regularly and started logging the license numbers of cars
that went to the house to buy dope.

After awhile he decided to tape record the calls as evidence.
He then turned his findings over to his local police department.

The local cops, armed with the information, contacted the
Michigan State Police Narcotics Enforcement Team. Their
investigation led to a raid which put the neighbor behind
bars and out of business.

Presumably, this new legislation would have made the
scanner buff the criminal and would have precluded
him from turning his information over to the police.

Think of a Pro-2006 with more channels, worse sensitivity, and a semi-useless
search and store feature that costs more than the 2006, and you have the 2035.

Wehn I bought my cell phone in California at a local dealer whose name escapes me, I was told that the fact that I was not going to also purchase activation was unethical and immoral even though it ws illegal. Furthermore the clerk told me that he had 15 years experience selling cellular.

I then pointed out to him that he was a liar and that if he said anything else insulting to me that both the Better Business Bureau and the California Department of Consumer Affairs would be informed of the dialogue. Regarding the accusation of him being a liar, I pointed out to him that cellular phones did not exist 15years ago. Boy did he get red in the face. I swear if I had touched a match to his face it would have ignited!

Apparently the abuses are pretty common despite the law we have in California that "protects us" from our own stupidity.

Good luck. It passed on a voice vote in the House and by unanimous consent
in the Senate so there is no paper trail on who voted for or against; although,
in principal you could say that noone in the Senate voted against the bill.

It seems af if a viable strategy would be to initially agree to programming/activation but once out of the store with the phone, realize that that portion of your sales contract must be void as an illegal transaction. Thus you would simply refuse to pay that portion of the credit card bill.

I am not an attorney, so I have no idea if this strategy is legal, doable, or even ethical.

I wanted to say that I do not intend to start an abortion discussion in
this group. It is inappropriate here. I do want to say that I mentioned
it to show how a law can be "intended" for one thing and then get
twisted around by some silly prosecutor somewhere and cited this as
an example. I had hoped that everyone would see this in the posting
but I am already starting to get mail from folks that apparently
did not.

So again, I do not want to start an abortion debate here, just want
to show how a dangerous law on the books can be twisted around.

Yupitera MVT-7100 multiband receiver (scanner) for sale.

Used for only a few hours.

Radio, manual, all accessories in original box.

Due to FCC regs, no longer importable into the US (because it is
a solid coverage radio which includes the cellular phone freqs).

My original cost was approx $630 (including shipping & customs).

Yours, including UPS shipping, for $625.

In principle, then, I will vote for no incumbents. Of course I had no
intention of voting for our senator up for re-election anyway. Can't
stand the woman (if that is what she really is!).

So Mr. Crisp reveals himself as yet another armchair activist.

If you were really all that concerned, you'd do the legwork and find out for
yourself. Heck, if you were all that concerned you'd have found out for
yourself, rather than having to ask "is this true? Did it really pass?"

This isn't intended as an insult, Richard. It's intended as a challenge.
If after a few days you come back with a message that starts out "Well, I did
the research and here's what I found out...", I'll be pleasantly surprised.

I have looked through my $2.00 Radio Shack catalog and have not found any specific references to either their price guarantee or their return policies.

I bought my PRO-43 on 08/17/94 and they went on sale on 09/29/94 :-(

Anybody know the exact wording of these policies or where to look it up?

I think I'll stop at my local Radio Shack store later today and have a friendly chat with the manager.

... and that would be the only reason to get one. I used to own one of
these several years ago. The scan rate was slow, it was not a very
user friendly scanner and the manufacturer made some bad assumptions
about delay timing, etc. The only interesting thing about this box
was the optional video interface card so you can tune cable channels
directly. Even at that, the video quality was pretty bad even off the
cable. I would recommend you go with the better Radio Shaft 2004, 5 or 6
while you can still find them.

3588. [Q] PRO39 better value than PRO49?

Newsgroup: rec.radio.scanner
Date: 1994-10-10 18:18:58 UTC
From: magarro@bbs.ug.eds.com
Message-ID: <1994Oct10.181858@bbs.ug.eds.com>
Source record: 267337

Hello,

I'm a newbie that posted an earlier message and would like to thank the people that responded.

I took their advise and went to my local Radio Shack to look at the PRO39 and PRO43 scanners. Besides the differences in features described in their catalogue, I found some aesthetic differences. The first and foremost difference is the sound quality. It seems like the PRO49 had too much bass. The PRO39 had a much more appealing, more treble sound. Secondly, the PRO49 was heavier.

It seems like, aesthetically, the PRO39 was a better value for $219 (down from $299) compared with the PRO43 at $299(down from $350? Right?

From a modification standpoint, If one wanted to get the missing 800Mhz frequencies, which unit PRO39 or PRO43 is easier to convert? I heard that modifying the PRO39 might delete some of the stored frequencies in the unit. What other "side effects" might one encounter if one modifies any of the two units?

Any help would be greatly appreciated from this radio scanner newbie.

Thanks,
Richard

Legal USA models, with cellular frequencies locked out of the internal
band table, are still awaiting FCC approval.

>Any user observations pro/con?

Slightly less sensitive, but also less intermod than the Yupiteru
MVT-7100. (Except some people have trouble with images clobbering desired
shorwave bands). Programming alphanumeric labels by hand gets very tedious
after one bank. This might be the radio which changes my "Who needs 'em"
attitude towards computer control of radios.

Lots of nice features, and good overall performance. A winner.

A triple conversion receiver is generally worth the extra money IF the first IF frequency is way high (i.e., around 600 MHz for the PRO-2006). A very high first IF practically eliminates the problem of image frequency reception.

I own both scanners you are looking at and the Pro43 blows the Bc200
away. The 43 is well worth the extra $'s especially if you plan on listening
to 800mhz. Uniden makes the Bc200 and Gre makes the 43.

I recently picked up a clean Bearcat 250 scanner and would love to see the operating manual. Would very much appreciate a photocopy of the docs - some features are not familiar to me, such as count, store, aux and recall, etc. Also I need to know if the unit has a clock and if so how to reset it.

I'd be happy to cover costs of photocopying and postage.

Please reply by e-mail.

Some RS's are franchises that set their own policies. Marymac, for example, charges a restocking fee.
Check the back of your sales slip.
Many states require the information to be posted prominently in the store.

Another idea would be to let the guy think you were going to go for his ripoff deal, and then after he brings out the phone (so you eliminate the "we're out of stock excuse"), then tell him at the last moment that you have changed your mind and no longer want the programming.

A second idea is to wear a hidden tape recorder and tape the entire transaction, and play the game as outlined above. When he tries the inevitable BS that we all expect tell him that you have taped the entire conversation and that your next stop is the local DA's office. If that doesn't put the fear of God in him, you probably are dealing with a fool, a heathen, or both.

Grady Ward (grady@netcom.com) wrote:
: After the President signs the bill, scanning cordless frequencies
: will be a federal crime.

: SEC. 202. CORDLESS TELEPHONES.

SO WHAT!!! ALL THIS WILL DO IS CAUSE A TEN-FOLD NUMBER OF PEOPLE LISTENING!!

Look what happened with the cellular sh*t, they made it hard to buy new units, other than importing them for reasons besides use (and then ignoring the original "reason"), such that the U.S. dealers are now finding it hard to compete, if not impossible with their overseas competitors.

Atlantic in Canada guarantees delivery or you do not pay, so please, no bull about how you can not do it.

The interest in cellular capable soared through the roof to new heights, I will bet there was a 1000% increase in the number of those listening to the cellular calls since the government put their heads in their *sses and gave it all this publicity.

Now try and tell me for one moment that this is not going to happen with the cordless phones? I mean, like heck, do you REALLY think the signing of a law will change anything? I know no-one will obey it, and a law is only as good as its enforcement. In the privacy of your home or vehicle, catching you in the act of listening to such activity is damn impossible.

I mean even in a vehicle, you would have it turned off before the guy arrived at the window, there went the evidence!! (Ok, you! in the car! throw the scanner out and get out with your hands up!!)

At home, by the time the door was broken down, the scanner would be off, and what judge is going to issue a search warrant on the grounds "it is believed you are listening to cordless phones"??? Ha Ha!

The is HILARIOUS. I had not actually pursued such pleasure for a long time, a number of weeks actually since I last had listened to them and the baby monitors (which share the same frequencies and are not offered any "privacy" protection under the new "law" as they are not cordless telephones but actual one way radio transmitter/receiver units), but after reading this sh*t recently, I decided it was time to resume it. Let's see, today there was a check on the bill at the power company, one check on a credit card account, a request of information on TV violence from several stations for a school paper... all in the last hour from my local neighbors on ONE channel, did not check the others yet!

They already made it illegal to sell descramblers for scanners, but I bought and built one specifically for that purpose. Works great on those speech inversion scrambling systems -- the ones that cost a little more, and it's a laugh to think they wasted $150 for a "scrambled" phone when they could have bought the same one for $99 with the same amount of "privacy". The only real solution is the digital ones in the 900mhz range for $300.

I have heard four neighbors all resting on cordless channel 10 - 46.97 mhz in the past hour, and I know others reside on other channels as I have a chart to look them up. Heck, if I wanted to break their busy signals, I could do a voice override via cordless by camping on the channel they are using -- I have an AT&T unit for cordless fun, and it allows manual channel selection! Yum.. yum..

So net result of new law -- the press can't publicize what they hear, crimes in progress via cordless can not be reported, the number of listeners will increase 1000% due to the publicity generated by the new law, and the amount of privacy will reduce by 3000% due to more folks purchasing them thinking "private" because the salesman said it's against the law to listen. HA HA HA.

IGNORE THE LAW!! (I know I will!) They have absolutely NO power to enforce the law, I mean how can they? Unless they start doing no-knock searches and such for "scanner contraband", it is impossible... is this now Nazi-USA?

Well Javiation in the UK has been shipping in full coverage units for a while now. Atlantic guarantees delivery in 2-3 days or no charge, that is in writing in any recent edition of Monitoring Times (they are in Canada).

So, yes, it's finally shipping! Don't bother with any U.S. based dealer, they can not delivery the full coverage units as the government will not allow them to market them in the U.S. That means EDCO and all their dealers.

These dealers did little to nothing about the cellular ban when it was looming in the distance, now we can make them pay by not giving them our business, as they can not deliver full coverage INTERNATIONAL scanners.

The only reason for the new law is to provide a bit of false security to the users and manufacturers of cordless/cell equipment to delay the inevitable adoption of cheap, hard crypto. The feds want to severely restrict crypto as evidenced by their failed attempt at ramming Clipper down our throats.

If the public doesn't get worked up by a few sensationalized stories involving embarrassing interceptions, there will be less demand for crypto protection in wireless equipment. Meanwhile the sneaky feds will have the time to ram some anti-crypto legislation through.

All they are doing is trying to buy time.

Well you could buy a new one, swap the innards and return it for refund, if you do not care about cellular coverage. Or you could swap the innards, and keep the digital board of the old one (assuming it still works ok) and keep cellular capability. Assemble broken innards into new case (has the serial number on the back!) and return for refund.

You may scream ETHICS, DISHONEST, THEFT, etc... But think of what Radio Shack did to US, the SCANNER ENTHUSIASTS!

They did NOTHING to stop the laws (we all regularly IGNORE) about cellular monitoring. They are in bed with the FCC and will rollover like a dog on command. They have refused to seek legal counsel and make an incident out of this, and I THOUGHT they were a large corporation. I was obviously WRONG.

So let them get stiffed with the junk. The above should fix any out of warranty problem for free and they OWE us for their obedience to the FCC.

3605. mods for pro2023?

Newsgroup: rec.radio.scanner
Date: 1994-10-10 21:45:10 UTC
From: sam@gold.gvg.tek.com
Message-ID: <37ccl6$gdn@gv-gate.gvg.tek.com>
Source record: 267466

Greetings Group!

I was wondering if their are any mods for the RS pro2023, I have checked oak.oakland.edu; ftp.catt.ncsu.edu & ftp.cs.buffalo.edu the closest I got was the 2022 & 2024.
Perhaps the 2023 is some kind of freak wanna-be scanner that isn't worth being modified?
any info would be appreciated.

Thank you -Scott

3606. 900 MHz & Scan Detection

Two items that interest me have not been followed up lately in rec.
radio.scanner: 1) i was interested in the report about the quality
of 900 MHz cordless phones, and i have not seen the final report
that was initiated here a while back. has any conclusion been
reached on what are the best models?
and 2) i really enjoyed the thread on detecting scanners, but it
seems to have died. does anyone have any charts showing, for
example, model scanner and where to look for Local Oscillator?
i found carriers in the proper place for my dual-conv scanner,
but had trouble on the triple conv detection - it was not where
it was supposed to be, even at two feet away. any followup on
these two items would be appreciated!

It's not so much who is President. You could make a good argument that during the 40 years that Democrats have dominated Congress, the trend has been toward more government control in our personal lives and the erosion of the Bill of Rights. But I think even that is too broad a brush; I prefer to look at the individual.

Although I've sneered at single-issue voters in the past, these days I'm fed up. Come November, I'll be voting against those who voted for the "Crime Bill" and I wouldn't be surprised if those same "representatives" are of the type who think they can regulate reception of radio waves.

>
>Brett Miller N7OLQ brett_miller@ccm.hf.intel.com
>Intel Corp.
>American Fork, UT DoD#1461

My PRO-2035 is more sensitive on 147 and 460 MHz than the PRO-2006
(and PRO-2005s) and about the same most other places. Image immunity
and desense performance is different for both models, though.

You can link search banks together on the PRO-2035 but not on the
PRO-2006.

No. If your premises have any merit, then it is we who did it to ourselves by buying their product when other options were available (for example, legally purchasing modifiable units from overseas). So I'll scream ETHICS, DISHONEST, THEFT, . . . well, maybe not scream, but those words do come to mind. Maybe it's more that if I'm going to give up my personal ethics and engage in what I consider unethical behavior, it'll be for something other than getting free repairs out of RS. But, to each his/her own, I guess.

It is ... 30 days!

The Radio Shack Store employee I talked to suggested coming back later to talk to the store manager. However, since my purchase is well over 30 days old, I feel that I would abuse an excellent return policy, if I tried to get a refund of the sale price vs catalog price difference this late.

So, I guess that I'm just SOL.

Oh, well ...

I had a Bearcat BC-250 a few years (_quite_ a few years) ago when that scanner was SOTA (State Of The Art). It had features I have since wished for in subsequent scanners I've purchased.

Unfortunately, the BC-250 power supplies had a nasty habit of going bad, and there were reports of failures of ICs that are no longer available.

I still have my BC-250, but it no longer scans. I also have the original owners manual and the service manual. These are, unfortunately, packed away in boxes and in storage, but if you can't get copies of the manuals from someone closer to POB 54, ALBURG, VT 05440, than California, I'll try to dig them out, when I get a chance.

:
: Well, obviously, the handheld radar guns used by police are *not* 250 watts.
: They are in fact in the range of 10 *milliwatts* to 25 *milliwatts*.

Correct.

: However, cops are in the habit of resting the guns in their laps when they
: aren't actively clocking a vehicle, and they *don't turn them off* for the
: entire shift. So they get a good near field dose to the testicles. Testicular
: cancer rates are higher among police who do traffic patrol. Figure what the
: power density is right at the mouth of a 17 db standard horn and you'll see
: the levels they are getting are above ANSI limits. This is also why you should
: never look into the antenna of a microwave transmitter, no matter if it is
: very low power. The ERP can still be above safety limits at very close range.

All the units I have seen have a trigger on them - so called "instant on"
units. There might be a high EM field, but no microwaves. Are the cops so
stupid that they would rest the mouth of an active radar unit on their
testicles? Highly unlikely.

Even if this were not true, I would expect the reflected waves to be much
higher than any leakage signal through the casing. Add in standing waves,

and you could get quite a few local hotspots - that would change position every time the unit moved a fraction of an inch.

Maybe the get the cancer from the sugar in their doughnuts.

Actually, most of the officers that get this form of cancer are motorcycle
officers since they must rest their gun near this part of their body
when chasing a car.
Also the officers in autos may incidentally rest the gun there if they
throw it down in a hurry to chase a "speeder".
It's not done by choice, that's guaranteed...

Hi Richard,

The "Japanese" version of the IC-R7100 has quite a few gaps &
does delete the Japanese cordless phones, cellular and other "personal"
bands. Frequencies covered when taken out of the box are:-

25.00 ~ 252.90
255.10 ~ 261.90
266.10 ~ 270.90
275.10 ~ 379.90
382.10 ~ 411.90
415.10 ~ 809.90
834.10 ~ 859.90
889.10 ~ 914.90
960.10 ~ 1000.00
1240.00 ~ 1300.00 (1999.99)

The last time I played with the Japanese version was 18 months or
so ago but I beleive these are still the current Japanese spec. By chance
these frequencies also omit the majority of US cellular. The German
& French versions also used to have differing frequency ommisions.

A short jumper wire between two empty pads on the logic board
restores 25 ~ 2GHz coverage on the Japanese model & I assume
would be the same on the German/French etc !

Cheers,

It isn't so much opening up the tuning range as it is having the required
front end tuned circuits. When you go beyond the intended frequency ranges
the front end tuned circuits act as filters, thus you'll get very little,
if anything outside the designed ranges.

I think what he was getting at is it's the only way you'll guarantee getting
back your 43 w/800 Mhz unrestricted coverage. Chances are high you'll get
a unit back that has been gutted and replaced by a non-restorable version.
If they guarateed NOT to do that, well that's another story. I wish we
could deal directly with GRE (if they're the real manufacturers).

This system, like all digital radio and television, satellite and cable systems which are evolving are all digital. The 60 channels you mention are 60 different digital streams which are bundled as 10 streams onto 6 different carriers. The 10 streams are Time Division Multiplexed together to form one big digital stream. This big digital stream then modulates an RF carrier using a modulation scheme called QPSK. The advantage of digital (for the programmer) is all channels can be encrypted with unique codes. Systems like these are great for people in business like broadcasters and (eventually) public service radio systems, BUT will kill the hobby as we know it since these codes will be UNDECODABLE.

I would like to dispell a few popular misconceptions here, as speculations seem to getting a little crazy. In order for any form of electromagnetic radiation to cause cancer it would have to trigger a change in your cells DNA. This normally takes the form of some sort of destruction or _mutation_. If the right sequence is changed in the right way, unihibited reproduction and lack of programmed cell lifetime may occur, i.e. cancer.

Now, this can only occur if the radiation you are exposed to is *ionizing* radiation, i.e. finite mass particles (electrons, protons, ions if energetic enough). The most common forms people are exposed to day to day are medical X-rays, and rocks in the soil. Electromagnetic radiation at the frequencies of light or below is *not* ionizing radiation. The coupling between this energy and cell structures in your body cannot be modeled as an interaction between a penetrating high enery particle and the cell. In order for this energy to couple into your body you would need a resonant structure whos size is some multiple or reasonable sub-multiple of the radition wavelength.

What is the wavelength of a 440 Mhz signal? It's roughly 70 cm. What structures inside your body are even 1/4 that size? Your arms and legs. Thats about it. Now, even at this the effect of the coupling will be to cause local heating. The amount of power required to heat these structures up to dangerous levels is certainly not legal for amateur operations. And thats assuming they would resonate. Since they are fairly heterogenious, I rather doubt they would. You may be able to put enough power into a smaller structure like your eyeball that would resonate, but you would need to operate at a wavelength on the order of 2.5 - 5 cm, or about 6 GHz. In order to couple into your DNA you would need wavelengths on the order of molecular sizes. That means particles.

There are molecules in your body that will exhibit vibrational resonance at frequencies in the microwave range. Water is the most common. So, if you operate at say 3-6 GHz and focus enough power into the proper structures in your body, you may cause some local heating. Note that in order to make this work in a microwave oven a fairly powerful magnetron feeds energy into an enclosed resonant cavity to build up the power levels to the required magnitude to cook your food. Note also that all you get is heating. This is unlikely to cause cancer, since to do that you must slightly damage the string without destroying its ability to function in the host cell. Cooking the cell just won't do.

Recently the FDA has responded to widespread fear of health effects due to power line and cellular telephone exposure by starting a rather large study on the biological and health effects of exposure electromagnetic fields. I attended a seminar at the University of Maryland sometime last year where the latest data was discussed. No conclusion was indicated, although they were trying very hard to find _some_ correlation. In some cases the data supported the conclusion that living under power lines *reduced* the likelyhood of

contracting some forms of cancer. This is counterintuitive. What it means is that any correlation is in the noise.

They have also failed on the theoretical and experimental fronts to show any mechanism for the alleged health effects of exposure to these fields, although they have just gotten started. They did show experimentally that exposure to strong magnetic fields caused isolated cells of one type to change shape. The cell would change back to normal when out of the field and no short or long term effects on the cells operation were found. I find this result far less surprising than they did, given that certain animals like birds can sense the earths magnetic field for use as a guidance mechanism. The cell would *have* to respond to a magnetic field in *some* way for birds to accomplish this feat!

So there you have it. Hams are more likely to suffer health effects from exposure to chemicals and smoke in their environment than from the EM radiation they produce, unless perhaps they have a full KW at 3 GHz running into an unmatched antenna taped to the ceiling of their shack. How many of those old WWII oil capacitors we used to play with contained PCB's, do you suppose?

3647. 900 MHz cordless phone evaluations

Newsgroup: rec.radio.scanner
Date: 1994-10-11 15:41:52 UTC
From: dsrekcc@prism.gatech.edu
Message-ID: <37ebo0$rdo@acmex.gatech.edu>
Source record: 267388

Sorry if this is a duplicate post; the first one went to net.oblivion ...

About a month ago I put out a call on the net for your comments and
experiences with 900 MHz cordless phones. The following is what I
finally distilled out of those responses. Note that these are
actual experiences, not rumor or manafacturer's claims (nor mine).
If your phone does not exhibit the performance problem indicated here,
well, great.

Below is a table of some basic performance comments, followed by more
lengthy comments on each model. I received over 2000 lines of comments,
and have edited _that_ down to 1200+ lines (~60K). Since posting those
comments would be an ENORMOUS waste of bandwidth, I will e-mail a copy
of that file to whoever really wants it.

If you have comments about your experiences with your phone, e-mail me
and I will include it in the final draft of this. I am of course
interested in data that is absent in the table below (e.g. Uniden duration).
Please don't e-mail just to "ditto" comments made here. Thanks.

Talk Handset
MODEL #R SS Sound Quality Range (ft) Duration Size
---------- -- --- ---------- ---------- -------- ---------
AT&T 9100/9120 5 Yes hissy, tinny "Good" Wide
BEL 900 1 No crystal clear "1 block"
Escort 9000/9020 4 Yes good, crappy 2.0 hrs
Panas. 9000/9220 6 No excellent "few 100" 0.5 hrs Flip
Sony SPP-ER1 1 No Big
Tropez 900 DL/DX 15 No* noisy, artifacts 300-1000 1.5 hrs Difficult
Uniden 9100/9200 13 Yes good but echo 500 Good

#R : Number of responses I got about this phone
SS : Spread spectrum encoded - This means that you're not broadcasting
your voice across the neighborhood, for all scanners to hear.
While a few people might be able to decipher it now, and some
scanners may do it in the future, you are at least secure from
95% of the "snoopers" out there. Me included.
If it's not SS, then you _can_ pick it up with a simple scanner.

COMMENTS:

AT&T
- 9120 is a speakerphone
- AT&T phone is OEM'd from VTech, the company that makes the Tropez.
The ergonomics are better, but the performance is about the same.

Escort
- The "good, crappy" comment in the table means I got conflicting
responses.

Panasonic
- Flip-phone style
- Dual batteries; extra battery does NOT power base in power outage.

Tropez
Note: while many people disliked the Tropez, some vehemently,
I should say that I received a few responses defending it.
- 900 DX is a speakerphone
- Range is apparently very good, at 1000 feet or more.
- The Tropez models are NOT spread spectrum. They use a single channel
16 kHz PCM signal about 100 kHz wide. While this means that Joe
Scanner can't pick up an easy FM signal, it also means that it is not
quite the level of security offered by spread spectrum. The digitized
audio is apparently coded to a random, shifting key (64K combinations),
so interception is still unlikely. On a plain scanner, your voice is
indeed unrecognizable (digital).
- It has been reported that clear audio (FM) leaks at around 430 MHz.

Uniden
- 9200 is two-line speakerphone with ability to charge extra battery.
Extra battery WILL power base in power outage.
- Almost everyone liked their Uniden, except for the echo.
The echo (and some said clipping and distortion) appears only in
your earpiece; the other person can't hear it, although you may
find it very irritating.

Miscellaneous

- Radio Shack and NorthWestern Bell models are possibly OEM'd, but I have
conflicting information on that. They are apparently not spread spectrum,
but just broadcast your audio in the clear (FM).

- Motorola makes a 49 MHz cordless phone that reverses the audio into
something unrecognizable on scanner. There's one of these in my
neighborhood; a plain scanner won't work on it, but it is pretty simple
to build a circuit to un-reverse the audio (see rec.radio.scanner).
The Motorola 49 Mhz apparently goes for around $400.

- From the FAF - Frequently Asked Frequencies file on oak.oakland.edu -

Panasonic KX-T9000 base 902.100-903.870 { 60 channels
handset 926.100-927.870 { 30 kHz spacing

VTech Tropez 900DX base 905.600-907.500 { 20 channels
(digital) handset 925.500-927.400 {100 kHz spacing

AT&T #9120 902.0-905.0 / 925.0-928.0 }
OTRON CORP. #CP-1000 902.1-903.9 / 926.1-927.9 } unconfirmed
SAMSUNG #SP-R912 903.0 / 927.0 }

That's because that part of Columbia County is pretty sparse.
You might check some Poughkeepsie area BBS systems. They often
contain freqs for the 914 and 518 area codes. Maybe an Albany BBS....

You should look up the discussion of this in "Physics Today" from
July or August 1994. The field strengths from RF even when close to
a high power system are smaller (by several orders of magnitude) than
the fields due to thermal flucuations (short range microscopic ones).
This makes me very suspicous that the epidemiologists have
found a non-causal correlation (not for the first time).
Actually, it's worth looking at how they
controled for activity profiles - unless you are doing manually
powered qrp on a pedal generator you're not getting much physical
activity when qso'ing. Since execise has a reproducable and measurable
effect on disease rates this is probably important. (i can come up
with other rationalizations like solder fumes if pressed).

Couldn't this problem be solved simply by passing a law that required cordless phone manufacturers to CLEARLY and PLAINLY print warnings on their packages stating that the phone could be monitored? I don't own such a phone, but a quick look at the packages in a store didn't reveal any obvious warning signs.

The cordless phone manufacturers could lose some sales this way, but it seems to me that the item causing the problem are the phones and not the scanners.

3654. Pro 43- 400 Channels.

Newsgroup: rec.radio.scanner
Date: 1994-10-11 16:57:33 UTC
From: kturner@infi.net
Message-ID: <37eg5t$aif@lucy.infi.net>
Source record: 267351

I think my post was the one that sparked the 400 why that many debate..
In my post i asked if anyone know of the mod to give 400 channels on the pro43... Someone did post a mod. That mod required a switch to access the additional 200 freqs tho..
I'm looking for the mod that does not require that switch.. I've heard of the mod being done before.. In the service manual, under 'General Operation Outline' it says (exact) :

Press [MANUAL]. When [MANUAL] is pressed again, the channel advances. To select one of the 1 through 400 channels, press the number key and the press [MANUAL].

Now that excerpt leads me to beleive that the pro43 is capable of accessing 400 channels directly..

Does anyone have this mod?

Thanks in advance..

I own a BC100XLT that is a refurb purchased from Damark 3 years ago and it still works the same as the day I got it. I paid $149 for it then, so I would certainly pay $169 for a refurbed 200xlt today!

In article <37ctqk$c5b@tbm128.thomas.com> Robert Pincus writes:

>As a newcommer to scanning, could someone explain to me
>thew difference between bands and channels?

Channel - a location in memory that holds a frequency. The scanner uses the data in each channel to tune the receiver to that frequency.

Bank - A grouping of channels usually in groups of 20, 40, or 100. Banks are there to make it easier to remember what is programmed in each channal, and allow you to scan only what you want to scan.

Band - A range of frequencies. This is a vary arbitrary term. It sometimes means the frequencies for a particular service like CB, marine, cellular, or it might mean a range of frequencies grouped by propagation characteristics, like HF band, UHF band, etc.

I hope that is what you were looking for.

How about posting the specific mod for the netters to file away for the rainy
day?

Thanks for taking the time to reply, Johathan. I saw the spec sheet
for the unit I got to twiddle the knob of and it claimed a gab
between 1000 and 1300mhz, but I checked and found it did display
frequencies in this forbidden zone. I wonder if they just do not
guarantee performance in this range?

The US cell band was deleted, at least the 869-894 range was.
Again I did all of this in a hurry and had to leave to head off
to a biz meeting, so I did not get the chance to fiddle too much.

I would assume the coverage was as spotty as the R100 Japanese version
which deleted the cordless and cell freqs as you mentioned. I just did not
remember the exact boundaries so did not test the freqs other than
the 869-894 and the 1000-1300mhz range.

loss will be negligible ?

Perhaps , if only receiving, xmting is another story. By using the correct type of torroid core, one can design a vhf broadband 75 to 50 xfrmr, or use the old transmission -line xfrmr technique, or design a pi network for this frequency, or modify (or try out first) your existing output network in your xmtr , to see if it can match to 75 ohms (using SWR meter)

>So, the Digital Wiretap Act outlawed the monitoring of Cordless Phone
>Calls? Same as Cellular Now? Or, what?

It appears so. The EFF may have had something to do with this. They added a number of "significant new privacy protections" to DigTel when they became convinced they would be unable to defeat the bill. Among the protections listed in their August 10 summary of the Edwards/Leahy bill is "an expansion of current law to protect the radio portion of cordless telephone conversations from unauthorized surveillance."

It's not clear that EFF actually got the cordless phone language inserted into the bill, but they certainly didn't object to it. I can only speculate on their rationale, but here's the speculation...

I believe that a Federal Court of Appeals (if not the Supremes themselves) had found that there is no "expectation of privacy" for conversations on cordless phones, so there is no problem intercepting conversations held on them. I believe this has been used by law enforcement agencies as a loophole to get around wiretap court order requirements. Perhaps the EFF thought that they were merely closing this loophole, and making law enforcement accountable to the same high standard for intercepting all phone conversations.

Of course, the statute doesn't apply merely to law enforcement agencies. It applies to everyone with a radio that can pick up 900 MHz. And it's likely to have a negative impact on the potential for truly secure cordless phones. ("Since it's illegal to listen in on corldess phones, of course nobody will do it. So why pay extra for encryption?")

Can anyone from EFF enlighten us on this issue?

Joe

Probably a typo, but hopefully not.

3670. PRO-43 Why no 108-118?

Newsgroup: rec.radio.scanner
Date: 1994-10-11 18:29:11 UTC
From: jim@ttech.com
Message-ID: <jim-111094102911@jimsmac.ttech.com>
Source record: 267374

I recently obtained a PRO-43 and performed the cellular mod. It seems to be an excellent scanner, however I have one question.....

Why is the 108-118 mhz frequencies missing (even the cheaper RS scanners has this range). I realize that these frequencies are used by aircraft VOR etc. Does anyone have a mod to restore this frequency range?

+-Jim

I noticed that several cell phone retailers in my area
(Sacramento Ca.) have fine print in their ad that says
if you don't activate, then you must order the phone.
Would this tactic be the same as requiring activation??
Haven't asked if the price is the same.

An aunt of mine received an offer from GTE (tel. 800-894-1539) of a Cobra scrambler cordless phone for $99.95. She wonders how secure it is.

She told me (over the phone :-) that the brochure describes the phone as having:

10 channel scanning
Clear Call Plus
Secure Lock
Digital Security Codes
7-day battery life

Does anyone have any information on this model? I assume it uses simple inversion scrambling, which is probably good enough for her home use. Is the voice quality OK? Other advice? Thank you!

Forgive me if this has been discussed here before but I am new to the group.

I recently purchased a RS Pro-51 for a few simple reasons:
1) I was interested in scanners and thought that this would be a good
first scanner.
2) I was told that the FCC would soon pull it due to the simple "mod".
3) The one I always fall for - ON SALE ($199)

I have recently seen some negative posts on this model and am wondering
if it is a good buy or not. I have a few days(well maybe not anymore)
left to return it and would like some last minute advice from the group.
So let er rip.

Thanks in advance

Rob

Here's a list which I down loaded from this newsgroup
last year. I don't remember the original author though.

Channel Base Handset
1 46.610 49.670
2 B 46.630 49.845 Chs A - E handset
3 C 46.670 49.860 frequencies are also
4 46.710 49.770 used for baby room
5 D 46.730 49.875 monitors and low power
6 A 46.770 49.830 handie-talkies
7 E 46.830 49.890
8 46.870 49.930
9 46.930 49.990
10 46.970 49.970

But if anyone gets caught illegally (US only) listening to
these -- you never got them from me (haha).

I wish it was that simple. I think our (US) government has gone far beyond 'people'. Its bigger than that. Business and PAC own the US, along with the govt, itself. The people in office are merely pawns. Voting one out and the other in has little effect. I wish I was wrong ... ;-(

I feel like a helpless pawn, myself. What, with the Clipper chip et al, we're stuck with Big Brother big-time. Freedom, as our founding fathers once envisioned, seems to be eroding. Truely a shame.

The answer: I wish to hell I knew! Maybe its time to get PGP - that will defeat Clipper, but the laws will still exist to serve the rule-makers and special interests.

Sorry about the no-scanner-content, but I don't think voting out the current rule-makers will help us in the long or short term ;-(

sigh.

I guess if we all followed your example, we would be answering everyone that asked "where can I get...." or "how do I ...." or "can anyone help...." with an authoritarian "go dig it out your self, schmuck"!

Lighten up Jamie, the net is a resource, some are more skilled at using than others.

For your information, I have checked every newspaper printed for the last week here in San Jose (as I may have mentioned I have been out of the country for the last two weeks), and how about it? Not a word of the fate of the bill at all. I did what I usually do for info and asked the usually helpful people on the net if they knew what had happened and if so could point me in the right direction. Furthermore, I have seen no mention of it on the TV either. Furthermore, I have been getting Email from some others that have also noted a seemingly conspiratorial absence of information about it.

Instead of being so arrogant, how about telling the rest of us dummies where you find your motherlode of information? My bet is you like poking jabs at folks seeking information to inflate your diminished self esteem!

Sheesh, with guys like you around directing traffic, I am amazed anyone stays on the net at all!

The trick they use around here is to offer lots of nifty rebates and
stuff, and the fine print reads that the rebates are only valid with
activation/one year contract/etc., which is of course perfectly legal,
since they always show the rebates in the advertised price...
course, that nifty little $130 motorola cell phone aint so nifty with a
nastyass 12 month PacTel Cellular contract on it... anyhow.

Cross-posted to: rec.radio.shortwave,rec.radio.scanner,alt.radio.scanner

I received an interestingly relevant feeling story today by email I'd like to share with you all. It seems amazingly relevant to the current situation at hand relative to the Digital Telephony Bill which was just passed by our foolish House and Senate.

Of course my primary interest in this poorly named legislation is not the wiretap aspect (as far as this forum is concerned), but in the parts of the bill that are not mentioned in the name of it: namely the scanner ban that I say is a feature of the legislation.

Perhaps the bill would be more accurately titled "the wiretap capability assurance, cellphone fraud enabling hardware ban and cordless phone pseudo-privacy bill". And of course the part I object to (again from the perspective of this forum) is the poorly written ban on hardware useful for committing cellphone fraud which I say extends to computers hooked to radios.

Of course I have a very big problem with the wiretap aspect of the bill and am absolutely appalled by the acceleration of the rate of encroachemnts of our liberties which have occurred under the Clinton Administration. I said Acceleration of the rate, too by the way!

But enough of that here comes the story, written by an anonymous, but very clever and wise netter:

There was once a far away land called Ruritania, and in Ruritania there was a strange phenomenon -- all the trees that grew in Ruritainia were transparent. Now, in the days when people had lived in mud huts, this had not been a problem, but now high-tech wood technology had been developed, and in the new age of wood, everyone in Ruritania found that their homes were all 100% see through. Now, until this point, no one ever thought of allowing the police to spy on someone's home, but the new technology made this tempting. This being a civilized country, however, warrants were required to use binoculars and watch someone in their home. The police, taking advantage of this, would get warrants to use binoculars and peer in to see what was going on. Occasionally, they would use binoculars without a warrant, but everyone pretended that this didn't happen.

One day, a smart man invented paint -- and if you painted your house, suddenly the police couldn't watch all your actions at will. Things would go back to the way they were in the old age -- completely private.

Indignant, the state decided to try to require that all homes have video cameras installed in every nook and cranny. "After all", they said, "with this new development crime could run rampant. Installing video cameras doesn't mean that the police get any new capability -- they are just keeping the old one."

A wise man pointed out that citizens were not obligated to make the lives of the police easy, that the police had survived all through the mud hut age without being able to watch the citizens at will, and that Ruritania was a civilized country where not everything that was expedient was permitted. For instance, in a neighboring country, it had been discovered that torture was an extremely effective way to solve crimes. Ruritania had banned this practice in spite of its expedience. Indeed, "why have warrants at all", he asked, "if we are interested only in expedience?"

A famous paint technologist, Dorothy Quisling, intervened however. She noted that people might take photographs of children masturbating should the new paint technology be widely deployed without safeguards, and the law was passed.

Soon it was discovered that some citizens would cover their mouths while speaking to each other, thus preventing the police from reading their lips through the video cameras. This had to be prevented, the police said. After all, it was preventing them from conducting their lawful surveillance. The wise man pointed out that the police had never before been allowed to listen in on people's homes, but Dorothy Quisling pointed out that people might use this new invention of covering their mouths with veils to discuss the kidnapping and mutilation of children. No one in the legislature wanted to be accused of being in favor of mutilating children, but then again, no one wanted to interfere in people's rights to wear what they liked, so a compromise was reached whereby all homes were installed with microphones in each room to accompany the video cameras. The wise man lamented few if any child mutilations had ever been solved by the old lip reading technology, but it was too late -- the microphones were installed everywhere.

However, it was discovered that this was insufficient to prevent citizens from hiding information from the authorities, because some of them would cleverly speak in languages that the police could not understand. A new law was proposed to force all citizens to speak at all times only in Ruritanian, and, for good measure, to require that they speak clearly and distinctly near the microphones. "After all", Dorothy Quisling pointed out, "they might be using the opportunity to speak in private to mask terrorist activities!" Terrorism struck terror into everyone's hearts, and they rejoiced at the brilliance of this new law.

Meanwhile, the wise man talked one evening to his friends on how all of this was making a sham of the constitution of Ruritania, of which all Ruritanians were proud. "Why", he asked, "are we obligated to sacrifice all our freedom and privacy to make the lives of the police

easier? There isn't any real evidence that this makes any big dent in crime anyway! All it does is make our privacy forfeit to the state!"

However, the wise man made the mistake of saying this, as the law required, in Ruritanian, clearly and distinctly, and near a microphone. Soon, the newly formed Ruritanian Secret Police arrived and took him off, and got him to confess by torturing him. Torture was, after all, far more efficient than the old methods, and had been recently instituted to stop the recent wave of people thinking obscene thoughts about tomatoes, which Dorothy Quisling noted was one of the major problems of the new age of plenty and joy.

end of story

Hello,

I used to have the post on how to mod the Pro-39 to pick up the business band. Could someone please repost it, I would appreciate it.

>telephone conversations from unauthorized surveillance."
>

Anyone want to venture a guess how long it will be before one cannot get
FCC type certification for a scanning receiver capable of picking up
cordless telephone conversations? From the time the ECPA was passed
in '86 which banned the listening of cellphone conversations until
the law passed in 92 prohibiting FCC certification of canning receivers
capable of picking up cell phone conversations was a long 6 years.
With the now liberal controlled House and Senate accelerating the
rate of encroachments of our liberties and the guaranteed rubber
stamp from Bill Clinton, I would expect it next session as some
one will point out there is already a precedent (as I just have) that
would justify it.

>Of course, the statute doesn't apply merely to law enforcement agencies.
>It applies to everyone with a radio that can pick up 900 MHz. And it's
>likely to have a negative impact on the potential for truly secure
>cordless phones. ("Since it's illegal to listen in on corldess phones, of
>course nobody will do it. So why pay extra for encryption?")
>

Yes, and this is the real reason for the scanner ban of 92 and the
new language in the current bill.

THE FEDS ARE TERRIFIED OF CHEAP HARD CRYPTO AND ARE DOING EVERYTHING
THEY CAN TO SLOW ITS ADOPTION. They are going after scanners because
they know if there are no scanners, there is a "sellable" story to you
and I that there is no one listening in.

The story is the same on the gun side of the law: the only reason for the
hysteria that resulted in the Civil Defense Weapon ban of the bogus
Crime Bill is that the government does not like the idea of the people
having the capability to wage a successful revolutionary war, as was

done in 1776. They had to fight a powerful lobby all along the way
so it took them a lot of years to finally get this much accomplished,
but in the case of radios, they have virtually no resistance.

Bottom line it will not take nearly as long because the Hams are the
only organized group and they wouldn't recoginize the nose of the
"ban-it" camel in their tent if it was in their face based on their
non-opposition to the '92 scanner ban.

So in order to slow down the rate of adoption of crypto phones until
they can get some sort of laws on the books that only permit "approved"
(ie defeatable) cypto, they will simply sacrifice the capability of you and
I to buy the kind of radios we want to buy.

I could care less for cellphone or cordless monitoring, it is fundamentally
uninteresting as far as I am concerned but I get damn excited when
foolish laws are passed which bastardize the frequency coverage of a
receiver citing an excuse which does not truly offer the intended
benefit.

The important thing here is the precedent that is set when such laws
are passed.

: Cellular monitoring is a federal crime right now but I don't hang my head
: out the window every time I crank up my scanner (or TV if I wanted to) and
: yell that I am doing it. Let them pass all the anti-listen laws they
: want. Problem is it effects the availability of the products that are
: capible of doing the listening.

The real problem is that the general public seems to support this
type of law for the reason they think it is like a theft of privacy. I
have found it very hard to express that these laws prohibit you to pick up
RF that passes through your property and body. The one description that
seems to work so far is:

"This law is like having some people having sex on the common
ground visible from your house and watching them is illegal. The only
difference is in this case what they are doing is legal."

Anyone else have a better description then telling them tuning an
old TV in the upper channels is also illegal?

There are those out there that have asked that the radio politics be set aside from these forums and for us all to get back to talking frequencies solving problems and helping people get the things they are after.

I would love to do this, but this is exactly like having your house catch on fire when you are having a party: no one likes the fact that there is a fire, but it cannot be ignored if you want to have a place to have a party in the future.

We are being hit from all sides with legislation coming from Washington banning many personal freedoms with no demonstrated benefit to society. We have an election coming up in a few weeks where the entire House of Representatives must be elected and a third of the Senate must be elected.

We have seen our liberties being grabbed for the last 10-12 years with the rate being sharply accelerated in the last two. I implore each and every one of you to send the strongest message permitted by the law to your elected representatives: throw them all out!

In America we have three boxes that matter. The Soapbox (which I am now standing on), the Ballot Box (which is what I am trying to convince you to use to rid ourselves of this cancer in Washington), and the Cartridge Box (which the Crime Bill is trying to take away from us).

Let's use the first two so we don't have to resort to the last!

Does anyone know the pin assignments for the 25 pin plug that plugs into
a motorola cellular phone?
I know that pins 3 & 16 are for power.
and pins 14 & 15 are for the hands free mic.
On my plug there is a jumper wire from pin 2 to 20
Does anyone know what this jumper is for?
Should this jumper be disconnected if i jump pins 20 and 21 for the
test mode?
Hope to hear from someone...
Thanks in advance
Ron

Hmmm, "for her home use"? Really? Tell me about it... There's a woman next street over with one of them speech inversion phones. She runs her credit card numbers over them, and all sorts of "home stuff". Really interesting how much folks who "think" it is private will say. Works perfectly clear using extra speaker and Ramsey descrambler. I would not suggest anything other than digital 900 mhz would be ok for "any" use which would mislead a person into thinking they are private when they aren't. If she does not want to spring $$$ for 900 mhz, don't waste money on the speech inversion types. $40 says it will be broken in a second by someone wanting to listen in.

I'd put a higher price on privacy than the cost of those speech inversion phones.

Just a guess, but I suspect it may disable 30 khz stepping. Check this
out to see if it steps in 12.5 khz stepping or 30. If 12.5 khz, finish the
mod to see if 30 khz stepping is enabled.

O.K. Here goes. These are the 10 universal cordless phone **BASE**
frequencies (don't even bother with the handset freq's)

1- 46.610
2- 46.630
3- 46.670
4- 46.710
5- 46.730
6- 46.770
7- 46.810
8- 46.830
9- 46.870
10- 46.910

Hope these help.

: 100% legal in all 50 states...and sugg. retail price is $199.99, kinda
: sounds neat-o to get on and figure out how it does it...

I suspect they will be paying a lot of bucks. One of the reasons for using laser is that the beam can be focused easily - since it is coherent, unlike radar. That means that the beam may not even strike the license plate. The beam could be kept to under a foot in diameter, at the points where the automobile's distance is determined - without even having to focus the beam. You cannot detect it, if it isn't there.

: frequency/pulse duration or coherency to turn all of the traffic lights
: green like emergency vehicles do. Or can you?

Sure you can. Some just use a strobe at a particular frequency, others
supposedly use a coded sequence - which would be harder to trigger.
Coherency is unnecessary.

Bull. You are not tapping anything. There is no law against wearing a "wire", and recording your conversations - even if the other person is unaware. Of course, this does not apply to police who are gathering evidence - stricter rules apply.

: has this range). I realize that these frequencies are used by aircraft VOR
: etc. Does anyone have a mod to restore this frequency range?
: +-Jim
: jim@ttech.com

I got my Pro-43 when they first came out and noticed this band left out.
I wrote to Bill Cheek and he said that it isn't there, and you can't do
anything about it. I was interested in wireless mikes, myself.

Source record: 267396

Does anybody out there scan the frequencies of IMMARSAT ?.
I have heard rumours of programmes around to copy faxes from the satellites
but as yet have not seen one. Where HF faxes are a broadcast to all, the
satellite faxes are to a particular machine and therein lies the challenge.

Cable Experts carries a full line of R/F cable and connectors as well as
accesories (coax seal, baluns, etc). Call them for a catalog. Their
service is great.

Yes - try some of these(see below).
There is a program to decode weather fax with a sound blaster board.
The author Paul Hitchcock can be found at "paulhtc@netcom.com" for

| This file is Available via CompuServe, Fidonet and Internet. |
| This file may be copeid and re-post to other boards without |
| permission, as long as the file remains unchanged. |

| Last Revised: 12th Mar-94 |

Technical specifications for F3C (example 120/576 on HF):

Class of emission: F3C
Bandwith (f0=1900 Hz): White +400 Hz (f0+400 Hz = 2300 Hz)
Black -400 Hz (f0-400 Hz = 1500 Hz)
(Low freq. (30-300 kHz f0+-150 Hz)
Index of correlation: 576
Drum speed (LPM): 120
Scanning Line Density: 3.8 lines/mm
Scanning frequency: 120 lines/minute
Start signals: Carrier modulated by 300 Hz for 5 seconds
Phasing signal: BLACK signal interrupted by 1 WHITE phasing pulse
per revolution of the facsimile drum, transmitted
for at least 30 seconds prior to the transmission
of the chart.
Stop signals: Carrier modulated by 450 Hz for 5 seconds followed
by 10 seconds of BLACK signal.

==- Chart (UNID) indentification -==

1- Find out the technical parameters (LPM/IOC), only stations working
with Russian equipment using LPM 90, that are normally CIS stations
or Ankara Meteo.

2- If the station transmitting in LSB/288/352 (negativ) and LPM 60 it is normally a Press photo station ie 60/352 or 60/288

3- Look in the corner of the chart for a indentification (4) number. The first two numbers is the orginating center indicator (distributed the chart).

01-09 WMCs: 01-03 Melbourne; 04-06 Moscow; 07-09 Washington.

10-25 AFRICA: 10+11 Cairo; 12+13 Dakar; 14+15 Nairobi; 16+17 Antanarivo 18+19 Tunis; 20 LasPalmas; 21 El Djazair; 22+23 Lagos

26-40 ASIA: 26+27 Khabarovsk; 28+29 Delhi; 30+31 Novosibirsk; 32+33 Tashkent; 34+35 Tokyo; 36 Bangkok; 37 Ulan Bator; 38+39 Beijing.

41-50 S.AMERICA: 41+42 Buenos Aires; 43+44 Brasilia; 45 Santiago.

51-63 N+C AMERICA: 51+52 Miami; 53+54 Montreal; 55 San Francisco; 56 Washington.

64-73 PACIFIC: 64 Honolulu; 65+66 Darwin; 67+68 Melbourne; 69+70 Wellington.

74-98 EUROPE: 74+75 Bracknell; 76+77 Moscow; 78+79 Offenbach; 80+81 Rome; 82+83 Norrkoeping; 84+85 Paris; 86 Helsinki; 87 Belgrade; 88 Oslo; 89 Prague; 90 Episkopi; 91 Ankara; 92 Frankfurt; 93 London; 94 Copenhagen; 95 Rota; 96 Athens

The last two numbers is the serial chart number by that center.

Example: 9220 92= WAFC Frankfurt (EDZW) serial number 20
6411 64= RAFC Honolulu serial number 11

Note: some stations using 5 numbers, than take the last four numbers.

4- Look for a four letter location indicator.

ADDN Darwin; AMMC Melbourne; BABJ Beijing; DEMS Delhi; EDZW Offenbach; EGRR Bracknell; EKMI Danish Met; FAPR Pretoria; FMEE Saint Denis; GOOY Dakar; HECA Cairo; HKNC Nairobi; KWBC Washington;KGWC Offut (USAF); LEMM Madrid; LERT Rota; LFPW Toulouse; LIIB Roma; LTAA; Ankara; OKPR Praque; RJTD Tokyo; RKSL Seoul; RUHB Khabarovsk; RUMS Moscow; RUNW Novo-sibirsk; RUTK Tashkent; SABM Buenos Aires; UKBB Kiyev; VTBB Bangkok.

====- HF FAX LIST -====

All frequencies carrier, use for USB -1.9 KHz, for LSB +1.9 KHz

Marked (*) frequencies are changed or new in the list.

Note: USN Stations Rota, San Francisco, and Diego Garcia changed the map format, and the schedules.
Between the maps now they turning the TX off !

Radio Hack has some very good stuff, it's the low-payed
knowledge-lacking employees that a lot of people have a
problem with.

To Radio Slack, the best employee is one that can sell
a lot of high markup items, not if they know what they
are selling, or what the best advice to offer a customer
would be. Granted, they are in the retail business, and
they need to sell items to make money, but since I used
to manage a Rat Shack, I know that many returns are due
to poor customer satisfaction. Many of the employees
didn't know a resistor from a capacitor, nor a tape deck
from a scanner.

If you want to buy from Radio Shloque, it's usually a
good idea to know exactly what you want before you go
into the store. Not all stores have lousy employees,
but around here, many are terrible.

Now, about buying a scanner, it depends a bit on what
you want from the scanner. Are you just going to try
a scanner, or are you sure you want one, and you want
to get a good one? If you want a good one, then I suggest
you spend a few bucks and pay for the better units,
like the Pro-43, and Pro-2006 handheld and base units.
These are considered to be two of the best scanners
made today.

Whichever scanner you do buy, it's a good idea to get
one that has 800 MHz and at least 100 channels. If you
are like most people, you'll find it's VERY easy to
fill up a 10 or 20 channel model. The local police in
my area alone, uses up to five channels...that's half
the memory channels of an inexpensive scanner! <Grin>

Look for features like triple conversion (which helps
reduce "copies" of the same frequency from interfering
with reception), 100+ channels, freq coverage of 29-54,
118-174, 400-512, 806-950+, priority channel, and freq
searching (to find new stuff).

You may not want to spend the extra $100 or so to get
a good scanner at first, but it's a sure bet you will
be really disappointed in a week or two when you realize
there are lots of freqs and features missing from a
cheap scanner.

Howdy.
I just bought my first scanner, a Radio Shack PRO-2027
100 channel and boy is it FUN!!!!!!

Since I am new to this can anyone tell me how to set up
a simple external antenna which connects to the BNC
connector on the back of the unit?

Thanks

3720. Help on Pro2006 Cellular Restoration

Newsgroup: rec.radio.scanner

Source record: 267306

Hello all:

A friend of mine recently modded his Pro2006 (its a few yrs old) for cellular.
The step size in the cell range doesn't seem to be the proper 30Khz.
I believe I read it here before that one must press the RESET button to
get the proper step size in that range.

Can someone confirm this for me?

This will also, I assume, clear all
the channels that are programmed.

Thanks!

Tim

Actually it isn't wire tapping. It's just like "hidden cameras" or "wired"
undercover folks, 60 Minutes, etc. Might get you sued if you aren't careful.
Wiretapping would be monitoring telephone conversations.

An interesting thing about wire taps in California. I don't know if the laws
have changed since I studied administration of justice 10 years ago but...
Wire taps are not permitted in California. Law enforcement uses them but the
warrants come from federal courts not state or local jurisdictions. This
includes cellular.

Land line and cellular "tapping" and tracing goes on everyday with warrants.
The carriers are obligated to provide the facilities for such operations.

So far as I know, she doesn't represent the Medellin Cartel or the Iraqui security service. :-) But she tells me she likes to talk without fear of being overheard (about her neighbors??), and she does some limited business on the phone.

Point well taken. I see that the new Rat Shack catalog offers a couple of 900 MHz models, one of which promises "Digital Spread Spectrum." I wonder if that's really secure, or does it just pick a channel and stay there until interference makes it move to another channel? In her environment it might stay on one channel for weeks!

negative. There is no wiretapping occurring. You are literally carrying the
tape recorder and mike on your person, you are perfectly aware of the
fact that the conversation is being recorded. No problem legally with this.

3727. Got an old crystal scanner

Newsgroup: rec.radio.scanner
Date: 1994-10-12 15:24:43 UTC
From: joep@bear.com
Message-ID: <39777@ursa.bear.com>
Source record: 267424

I recently acquired an old "Lake" (made in Japan) 8 channel Vhf/Uhf
scanner. It has 4 channels in each band and an antenna jack for each
band. It had the local weather freq. crystal installed (The only crystal,
but hey for nothing, what can I say...) It's dual voltage and has the 110v
power cord. I plugged it in and it worked! Had to use a makeshift antenna for
now...but it worked. Next I went to Radio Shack and ordered about six crystals
@ $4.99 each. (They should be in soon(7-10 business days))
Okay so you made it to the questions (Did you think I was just telling a story!?!)

I plan on using this in my car (I'm a volunteer firefighter so it's ok)and I'll
need to figure which pins to use for 12v. Will they be the ones _not_ being
used by the 110v or will the ground be common? The socket looks something like:
(crude ascii drawing)

```
_______
|o o o o|
-------
```

I can experiment with a 12v power supply but I'd hate to fry this thing.

Also it has two separate antenna jacks (one for each band) and I only want to
use one antenna. Is there an adaptor I can use or do I need to make something up?

Sorry for being long winded but hey, that's just me..

3728. 2006 squelch

Newsgroup: rec.radio.scanner
Date: 1994-10-12 15:29:24 UTC
From: necakov@dev2.bear.com
Message-ID: <39778@ursa.bear.com>
Source record: 267275

I've recently picked up a new, fresh out of the box pro-2006. The only other scanner I own is a Pro-51. I'm happy with the 2006 except for the squelch. On my Pro-51 when I turn the squelch to a certain point it completely blocks out noise and weak signals like its supposed to. The 2006's squelch seems less, lets say, absolute. The noise and weak signals come in and cut out, back and forth unless I turn the squelch up very high. I was wondering if this is characteristic of this model or if there may be something wrong with my particular unit. I've seen a mod for the 2006 that alters the squelch hysteresis. Does this address the problem I'm having? The only definition of hysteresis I could find is as follows:

a retardation of the effect when the forces acting upon a body are changed (as if from viscosity or internal friction);
esp: a lagging in the values of resulting magnetization in a magnetic material (as iron) due to a changing magnetizing force

Thanks for any light you can shed on this darkness.

|crisp@netcom.com (Richard Crisp) writes:
|:
|: for the same reason the NRA did not oppose the machine gun ban of 1986.

I think this is a bad rap on NRA. The McClure-Volkmer Firearms Owners Protection Act (FOPA) had the Hughes MG ban added at the last minute by some Representative from Florida, whose name escapes me. I believe the FL Representative was later convicted of some crime. NRA spent YEARS trying to get the FOPA passed, and had to accept other so-called "compromises" like removing the provisions to allow interstate handgun sales. NRA did do some stupid stuff later on the FOPA that monkeyed with the "safe transit" provisions concerning the transportation of firearms & ammunition. Ostensibly, NRA accepted the MG ban in the FOPA to get the other provisons; NRA stated that the MG ban would be fought in court. NRA kept it's word, and DID fight it in court. Unfortunately, the U.S. Judiciary despises gun ownership, because their members consider themselves imperial and the general public fools. NRA lost in the lower courts, and the U.S. Supreme Court refused to hear the case, just like the Morton Grove Handgun Ban case.

Richard,

If a modifiable scanner (full 800Mhz) is what you're priority is, then
the Pro-39 is the best bet, unless you get a Pro-43 with no A in the
serial number nor in the FCC-ID (manufacturing date no later than 1A4).
All Pro-39's are modifiable, so that may help your decision. The 43 has
triple conversion so it will be much less prone to images, especially
at 800Mhz. I found the images were not a problem with the Pro-39; the
800Mhz public service freq's won't interfere with 869-894 reception,
if that;s what you're after.

BTW, the 43 covers the 225-400 UHF Air band. Not toomuch activity there,
most of the military training activity I listen to here in Maryland
falls into the LOW BAND VHF (30-50Mhz) range anyway. Good luck.

Andy

3735. "Negative Pulse" Nicad Charger (Mfg. Source ??)

In the local paper this morning, there was an article about a woman who was arrested for marijuana possession as a result of cordless phone monitoring by a police department. The unusual twist is that she was on a *corded* phone and the *other end* was a 49MHz cordless phone. The person with the cordless phone was not arrested (as least as of the story's writing).

While I have no sympathy for drug dealers/users who use cordless phones and get caught, this is a bit of a gray area. Should cordless phones give some sort of warning for corded phone users on the other end, sort of like the 'beep' given by (legal) phone recording devices? If I want a conversation kept private, should I have to ask every time if the other end is on a cordless phone?

As a scanner user, I'm quite aware that when I use my cordless phone, I'm effectively broadcasting my phone conversation to the local area. I had never quite considered that the same thing happens (at the other end) whenever I call someone else with a cordless phone.

Should the law/rules of evidence be changed so that the phone conversation can be used only against the cordless phone's user? A corded phone user has a reasonable expectation of privacy, but the cordless phone user doesn't (if it's got an antenna, it ain't private).

I believe as a private citizen, I have the right to monitor any radio waves that pass by - it's up to the transmitter to do any required encryption to prevent monitoring. However, it's a little less clear when the state is doing the monitoring.

As a side note, the police department involved now has a policy where the chief must approve monitoring beforehand. Other police departments interviewed say they do not use scanners for law enforcement action.

>Use RG-6, it is the best for the money by far.

If you're going for large-diameter cable, you may as well get the right impedance match and get RG-8. RG-6 is 75-ohm cable and is primarily used for CATV. The best 50-ohm cable short of getting hardline is Belden 9913 - this is used for ham radio applications. There are a few different versions of RG-8, with different shielding, etc. - I believe one of them is equivalent in quality to RG-6 but the correct (50 ohm) impedance.

Since your cable run is only 10-15ft, the flexibility, smaller diameter, and lower cost of RG-58 will more than likely offset its higher loss. Even for transmitting applications, the difference between RG-8 and RG-58 only becomes noticeable at longer lenghts.

Impedance differences are not as critical for receive-only applications, but may be comparable to the difference between using RG-8 and RG-58.

On a side note, I don't see the difference between alt.r.s. and rec.r.s. that an earlier poster did. I read r.r.s. first and I only see a handful of topics in a.r.s. not already covered. I definitely don't see the "hacker" tilt on a.r.s. Since r.r.s. is the preferred and more heavily used group, note the follow-up setting.

Advance Tech in Florida makes/distributes 6 and 7.2V chargers for cellular
phones, which use the negative pulse method. Don't have their address
here, but Hello Direct (1-800-444-3556) sells them.

3741. How many Birdies??

Newsgroup: rec.radio.scanner
Date: 1994-10-12 18:57:57 UTC
From: ccartee@regal.cisco.com
Message-ID: <CCARTEE.94Oct12115757@regal.cisco.com>
Source record: 267411

I am new to scanning and just recently purchased a BearCat 2500XLT.
In the manual they list all of the birdie frequencies. The list
'looks' rather large, but when I consider the range of the scanner, it
is a small fraction of the possible reception frequencies. My
question is how many birdies do some of the other popular scanners on
the net have? How does the conversion scheme (double/triple) affect
birdies? Are portable units more likely to have more birdies?

>as of the story's writing).

What's equally interesting is why they were monitoring the cordless
phone at all then. I also wonder how they tracked down the person
who was on the cord phone. In fairness, though, both parties could've
been suspects for some other reason and the locations known beforehand.

>I had never quite considered that the same thing happens (at the other
>end) whenever I call someone else with a cordless phone.

Cordless and cellular is so popular these days that I automatcally assume
that the other party has one and that whatever's being said is also being
received by others. I got a call once from a friend who proudly announced
she was calling from her bathtub. After confirming she was using a cordless
phone, I told her that everything she's saying is most likely being monitored.
She really didn't believe me.

Sometimes when I'm talking on my cell phone I'll deliberately say outrageous
things or somehow acknowledge the scanner audience. Hey, I might even have a
fan club. :-)

>I believe as a private citizen, I have the right to monitor any radio
>waves that pass by - it's up to the transmitter to do any required

Claude Alan Cartee <ccartee@regal.cisco.com> wrote:

> ... How does the conversion scheme (double/triple) affect
>birdies? .....

One source of "fixed" birdies is the crystal controlled oscillators
used in multiconversion receivers. For example the Radio Shack
PRO-2006 has crystal controlled local oscillators at 37.8 (for WFM)
and 48.045 MHz (for NFM and AM). Also, there's a 12 MHz clock
for the CPU and a 10 MHz oscillator used for the synthesizer's
reference oscillator.

It's not difficult to imagine that you can hear the harmonics
of these oscillators, and the sums and differences of integer
multiples of one or more oscillators (e.g., N*X + M*Y and
N*X - M*Y) if they are not well shielded or the signals leak
through the mixers.

The fixed oscillators can mix with other signals inside the
receiver, like the tuneable local oscillator signal
or its harmonics, the CPU clock crystal, or even the crystal
controlled reference oscillator used in the synthesizer.

Another source of birdies, never documented in the specs,
is an unstable amplifier stage going into oscillation.
That causes what I term "drifting birdies" or growling noises
which are generated within a receiver and seem to float up and down
a band.

There are 91 fixed birdies listed in the new PRO-2035 owner's manual.

I think he actually did think it was a joke. From past experience,
banning a frequency range to scan just draws more attention to the
frequencies and there is more of an increase in monitoring, rather
than the intended decrease. I could see how someone would have thougth
this post was tougue-and-cheek. Anyways, hope this helps you out.

The problem even goes beyond that. Many people leave rather detailed voice mail in my industry. Often this is filled with all sorts of information that could be damaging in the wrong hands. Things like deals, competitive information etc.

many times people check their voice mail with cellular or cordless phones. You may want to keep this in mind when you leave voice mail in the future.

the problem is you would accelerate the market demand for crypto phones,
something the FEDs and the local keystone cops really do not want to
see happening. I tis far better from their parochial perspective to
pass laws whihc inhibit your ability to enjoy a hobby to buy a bit
of futile time than it is to permit everyone to be hammered with the
facts that unprotected radio conmmunications are vulnerable.

Remember that you have no organization like the NRA to protect your
interests, hence it should not be a surprise to see how fast the
liberty grabbing Clinton Administration is moving in this area.

Remember this when you Vote in November. You are planning on voting
aren't you?

I own both the PRO-43 and the BC200xlt. The PRO-43 is by far the better of the two. The PRO-43 is faster, smaller, easier to use, has less intermod, better technical support through the Shack's parts and service manual availabity, and the PRO-43 uses regular batteries (Nicad or alkaline) whereas the BC200
uses a custom battery pack. If it goes while your out or on vacation you're stuck until you can get a new one, and they're expensive! Spend the extra and get a PRO-43!!

> Can someone confirm this for me?

It should. On my 2006, it automatically goes to 30 khz spacing in that
869 - 894 mhz range. Pressing reset will change it to that, or to the
scanner's default scanning spacing/modes for the frequency range you're
in, if you changed it. If all else fails, press the 'step' button,
until you get the proper spacing in the range you're im.

> This will also, I assume, clear all
> the channels that are programmed.

Nope. Not true. Just pressing the reset button in front, won't clear
all your memories. If that was true, that would be a poor design flaw
of the unit. I probably press that button accidentally every time
I use it. People would be wiping out their scanner's memory every
time they use it. I'm not sure of the exact command to clear everything,
since I've never used it. I would have to check the manual, but I
think it involves pushing a couple of buttons in front, while
depressing something in the back of the scanner too. Hardly something
that would be done by accident. But I did lose my memories once, which
was caused by my 9 volt battery inside somehow coming loose. What a
pain to put all my frequencies back in.

3760. Need some info on the AR1500 ...

Newsgroup: rec.radio.scanner
Date: 1994-10-13 03:16:51 UTC
From: Tim <tmfreeman@delphi.com>

Hellllo ...

I want to know more about the AR1500 ...

Who out there owns one that can tell me about the price, coverage, quality, etc..
What about this "huge" "complete" range? Does it have to be modified to get the ".5Mhz to 1300Mhz range?

Thanks,
-Tim...

for informational purposes, of course

3761. Off-topic postings

Newsgroup: rec.radio.scanner

I know how to use a kill file, I know how to skip over news items that I don't wish to read, and, as I rule, I don't get involved in discussions of off-topic posts because it only encourages them. But a real problem has developed: off-topic posts are distracting us from keeping our eyes on the prize--the prevention and removal of any restrictions on the right to monitor over-the-air transmissions.

The reasons behind restrictions on monitoring may be of academic or general interest but in rec.radio.scanner they should be incidental. In rec.radio.scanner, arguments about whether restrictions arise from pro or anti bias toward liberals, conservatives, elected officials, or the right to bear arms are distractions. Restrictions should be anathema regardless of what motivated them. A conspiracy theorist might suggest that these distractions were introduced just to paralize a group of individuals who might otherwise be highly effective in fighting monitoring restrictions.

If I understand the content of many recent posts, the House and Senate have passed a crime bill making it illegal to listen to cordless phones nationwide. Why were we not united against this? I recall a series of posts about a bill that began "knowningly and with intent to defraud", but *nothing* about a bill that would put a blanket prohibition on listening to frequencies used by cordless phones.

There is much we could have done with some warning. Not all elected officials are morally bankrupt. Many merely need to be educated so that they are not blindsided by unscrupulous colleagues. It takes only one or two to introduce a provision in such a way that others are likely to overlook it. I wish I'd known what was going on. My congressman is someone I have confidence in and with whom I would have discussed the issue.

Obviously, the group will have its way and people will discuss and argue about whatever they want to, but I hope that we don't go so far off topic that we forget what is on topic.

The RESET button on the front of the scanner resets the spacing (30KHz)
and mode to factory defaults. The RESTART button on the back erases
the memories, should only need this if the CPU locks up on you.

Hi, I've asked for several mods while on this base, and I was wondering for my father if there is a mod. for the BearCat 210? This mod would be for upgrading it so it can receive the higher freqs. that the new models can get. My dad doesn't want to pay several hundred dollars for a new scanner when his works perfectly fine. Well dig into the vaults and see what you come up with any suggestions would be appreciated. If there is a diode or a chip or anything that can be replace or added. Also if added so the scanner can get Cell Phone freqs.

Thanks Corey

Source record: 267304

Oh hi,

Well I got the service manual for the thing and here how far I got....

I got the thing to accept entries from 25 thru 1300 mhz, by grounding pin 3 on the empty connector on the main motherboard, but it didn't receive anything outside of the stock range. I discovered that when freqs. are entered outside of the "stock" range it would kill the first IF stage. Removed two diodes (they are right beside pins one and two of the empty connector) to fix that, but still doesn't receive. The unit has four band stages for the first IF, and depending on what freq. range your in, it selects a band. For example 50-99 mhz would be band 1. When I select 49.999 mhz it goes and selects band 3 which is a very bad thing for it to do. The band selectors come straight from the processor, thus I figure the must be some key sequence required for making it keep the proper band selected when entering freqs outside of the stock range.

so close....

Inmarsat-A is an analog system. You'd receive FAX from it the same way you'd
"phone tap" a fax off a telephone line.

You ain't gonna do that with Inmarsat-M or Inmarsat-B as they are scrambled
digital protocols which require a non-trivial receiver.

(bunch of interesting but very speculative comentary deleted)

OK.

1. Most radars in patrol cars are permanently mounted. More so than handheld models. For instance the Iowa State Patrol has both a forward and rear mounted antenna. In the patrol car I drive in NW Iowa, our antenna is mounted on a rotating mount so it swings around, and works just as well as a handheld.

2. Officers place the antenna between their legs, because the are bored and not thinking. The passenger side floor is the best place for it. An officer does not want to have to many obstructions if he needs to get out of the car(or at least try to get out of the car.) I also agree some officers do eat to much junk(donuts) and that is why many die because they were to unhealthy.

3. Laser was invented for the patrol because of two reasons. First, it is tougher to detect because it diffuses very fast and doesn't carry the signature that sets many K or X radar detectors off. Second, it gives a much stronger signal as compared to K or X. With old radar it is very tough to get small vehicles on radar, unless they go very fast.

4. A new brand of Canadian radar now comes with a detector that hunts out jammers. It is available in the U.S. and it does detect laser radar jammers(I have only seen ads). There are also detectors that detect these detectors. Be advised that if you are caught with a jammer not only do you face a stiff state fine but you may be prosectuted under the federal code which is 5 yrs. and $10k. In Iowa it is a simple misdemeanor(30 days and/or $150 fine). I can promise if you are caught by an officer plan on getting a ticket and a possible vehicle inspection and impoundment to determine if there are any other devices in you vehicle(Yes, it is all legal).

5. Do not lay too much faith in all types of radar detectors. An officer does not have to show you his speed he locked you in at but it is a custom. An officer does not have to lock you in on the gun, most do but it is not required by law. If you show 71 then drop to 62, I can still give you a ticket at 71. Radar detectors only protect you because the beam did not directly hit you. It is the radiation on the beam striking various objects that gives you a signal. I will also say no one can beat the radar by slowing down. If an officer wants to stop you he will, do not think it is the radar detector warning you. If I see a radical drop in speed when I turn on the radar, I will stop that vehicle 100% of the time.

6. Police motorcycles also have permanent mounts and the handhelds have a holster on the bike. Most motor officers know better than to place the unit between their legs because it may side out and get caught on the bike or destroy the radar unit and the last thing an officer needs is to get tangled in his radar unit.

I just thought I would give some insight into the radar issue. MPH the largest manufacturer of radar was sued by an officer because of the cancer debate. It was found that there was only a microscopic chance that radar could cause cancer and that his main problem was that he was unhealthy(fat).

Warning: Newbie with <2 weeks lurking ahead, please flame gently...

I am looking at purchasing a scanner in the near future. After reading this group for a short while and browsing through a couple of books and catalogs, I've noticed a lack of coverage for 26-27 MHz freqs.

Are scanner enthusiasts not interested in CB chatter, and manufacturers intentionally excluding these frequencies (no demand -> no product) ? Or is it a matter of poor performance below the 29-30 MHz lower limit on most portables.

I intend to use my unit on the road, and would rather not have to purchase a separate CB unit.

Jordan

*** Bob's Tip of the Month ***

(from Monitoring Times, January 1993, Dial 1-800-438-8155, Great Magazine!)

Realistic (R) PRO-39 Cellular Restoration (Page 107)

[with a few comments added by someone who witnessed such restoration -jqt]

The recently released PRO-39 handheld scanner from Realistic (R)
is a fine performer, but its 800 MHz range is interrupted by the
factory censoring of cellular frequency coverage. Long-time MT
supporter Larry Wiland of Youngstown, Ohio, would like to share the
simple fix. Remember, however, that it is unlawful to listen to
cellular phone calls.

(NOTE: These procedures may void your warranty. Do not attempt
them unless you are familiar with small component soldering.
Monitoring Times accepts no responsibility for damages resulting from
attempting this modification.)

TOOLS NEEDED: Fine-tipped soldering iron, desoldering wick,
small Philips screwdriver, long-nosed pliers, rosin-core solder.

(1) [Turn off your radio. Removing the batteries when the radio is ON can
erase the memory! -jqt] Remove the battery door, holder and [battery
pack] from the bottom of the radio.

(2) Remove the four screws from the back of the scanner and carefully lift
the back off.

(3) Unplug the two wiring harnesses at their connectors and remove the six
bright colored screws [that hold] the circuit board in place. Unsolder

the ground wire from the lower right corner of the circuit board. Unsolder the two wire connections from the BNC antenna connector at the board. Carefully lift the board (grasping it near the Molex connector) and set it aside.

(4) Remove the two bright colored screws from the next circuit board. Carefully unplug the two-wire connector [and remove the board, as I recall -jqt]. Unsolder and lift the rectangular metal shield exposing the diodes.

(5) Carefully unsolder and remove diode D6 only; this will restore the missing cellular frequencies which can be searched in appropriate 30 kHz steps.

This completes the cellular restoration. Reverse all procedures to reassemble the radio and test it by entering any frequency between 869-894 MHz. [If you are as lucky as I was, the memory will still contain your other frequencies! -jqt]

>
Regardless of whether it is illegal to transmit light (or whether light
is rf and comes under the FCC) any activity that INTERFERES with a
legal police activity is illegal in most jurisdictions. And no court
is going to allow a defense that relies on our rights to free speech or
that claims that this is a federal premption.

You probably have the right to transmit at any laser frequencies because
the FCC doesn't have jurisdiction at light frequencies although they
have jurisdiction over rf which light is. But you can't interfere with
the police measuring speed limits whether it's your speed or some one
else's. And most legal experts agree that the states can regulate your
rights to monitor the police radar signals. Look at Virginia where
it is illegal to have a radar detector in your car. The courts have
held that this Va law does not violate your federal rights.

REVIEW: SCANNER MASTER MASSACHUSETTS COMMUNICATIONS GUIDE, 5th Edition
EDITOR: Edward Soomre N1BFF Editor & Publisher: Richard Barnett KA1PYJ

A complete resource of public safety operations and one-and-two-way
communications in the Commonwealth....692 pages...ISBN 0-939430-25-8
available from SCANNERMASTER PO Box 428, Newton Highlands MA 02161.
Tel: 1-800-722-6701. Price: $29.95

The ever popular MASSACHUSETTS SCANNER MASTER has been completely
revised and the Fifth Edition, published in December 1993 is now available.
There have been many changes in the two-way communications scene in the
Bay State and the SCANNER MASTER has undergone a timely overhaul to keep
up with them. The biggest change was to the State Police - last year
state-level Metropolitan District Commission Police, Registry of Motor
Vehicle Police and Capitol Police departments were all merged into the State
Police. Since each had its own separate radio communications system this
was changed to accomodate the new, larger Massachusetts State Police. The
5th Edition features a special State Police section with 30 pages of
incredible detail on their new 800 MHz system and was written with
the assistance of most of the senior state public safety radio managers.

The SCANNER MASTER is produced for the scanner and radio hobbyist and
is an invaluable reference source for beginner and seasoned veteran alike.
Many technical matters are explained and there are photographs of major
dispatch centers, illustrations, organizational charts and plenty of maps.
Also included are profiles of several of the more important "movers-and-
shakers in Massachusetts communications. Some of the other "goodies" you
will find are complete, VERIFIED ham repeater listings from information
supplied directly by regional frequency co-ordinators, a huge new Federal
section with FBI, DEA, Customs etc, great railroad, MBTA and airport detail
and updated Notification Net information with the Metro Radio Syatem codes
and frequencies.

Probably the most innovative technology in the comunications business
is the new 800 MHz trunking system. The SCANNER MASTER has a section on how
to monitor trunking and has a complete listing of all 800 MHz trunking
business users. Other frequency guides list all trunking users at 806.10
from the FCC data. SCANNER MASTER researchers have taken considerable
time and effort to look up the SMR callsign of EACH 800 MHz user (and they
really have to dig for this!) and can accurately correlate this data to
determine which repeater is being used so the listings in this category can
be more specific and accurate. EVERY business license in the state is listed
including the new 220 MHz narrowband licensees.

The SCANNER MASTER is broken down into five major sections. The first 185 pages describe in great detail the functions, jurisdictions, equipment and radio usage of every state, county, federal and regional agency, including State Police, Mass Highways, MEMA, MWRA, Massport, MBTA, marine, Coast Guard, aviation, news media and a lot more. The Community Section provides an alphabetical listing of every community in the State along with ALL radio licensees, including PL tone code information where applicable. Information on police usage is extremely detailed - including roll-call times, codes, station/unit identifiers, maps, charts, etc. The New England Public Safety Frequency Sort includes ALL police, fire,ambulance/EMS, municipal service listed in frequency order (to assist you in identifying what you are hearing). The Business Frequency Sort section lists all non-public safety agencies in frequency order and finally, the Business Type Sort lists all businesses in the guide in alphabetical order. Unfortuntely, due to space limitations the popular fire department and community profiles sections had to be left out of the Fifth edition.

There is so much more to this book. It is an invaluable reference but, more important, it can be read like a book and is packed with a lot of good reliable information. I an fairly new to scanner monitoring but my 4th edition of the SCANNER MASTER provided me with a good foundation of knowledge. The Fifth edition contains so much more timely and up-to-date data to make the hobby more fascinating and enjoyable. I've looked at the other books available in this area and the SCANNER MASTER is THE best reference source. Anyone can get the raw F.C.C. data, but editors Soomre and Barnett have done an excellent job of explaining, clarifying and amplifying the information which is something the others have failed to do. I highly recommend this book to scanner enthusiasts in the Commonwealth.

SCANNER MASTER produces guides for other areas as well and in the next few weeks I hope to examine some of them and report my findings. But, if they are of the same caliber as the MASSACHUSETTS GUIDE I can tell you now that they're going to be great!

If your squelch has too much hysteresis, the knob will
act something like a car's steering wheel with too much "play."

Disconnect the antenna on the PRO-2006, turn it on, and program
it to an unused frequency.

Rotate the squelch knob fully counter clockwise,
so the squelch is open and you hear all the white noise.

Slowly rotate the knob clockwise just until the squelch closes,
i.e., the noise is silenced.
Make note of this knob position (e.g., 10 o'clock position).

Slowly rotate the knob counterclockwise just until the squelch opens
and you hear the write noise.
Make note of this knob position (e.g., 10 o'clock position).

Compare the 2 knob positions. They should be different, but not
by too much. The further apart the two knob positions are, the
more hysteresis your squelch circuit has.

As a very rough rule of thumb, I prefer the two positions
to be within 1/2 - 1 hour of each other.

You do need *some* hysteresis or else the squelch will open
on popping noises and noisey, fading signals when set near
its threshhold.

IMPROVE THE SQUELCH IN YOUR MONITOR RECEIVER

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of

the author. Free distribution is encouraged.]

The squelch control in some FM monitor receivers is difficult to use because of too much hysteresis. The American Heritage Dictionary of the English Language defines hysteresis as the:

o "Failure of a property changed by an external agent to return to its original value when the cause of the change is removed."

It's like having play in a car's steering wheel, or backlash in a gear set. Too much hysteresis in a squelch circuit forces one to keep the squelch at a tighter setting, missing weaker signals when scanning or searching. The squelch hysteresis problem was first addressed in a 1984 article about the Radio Shack PRO-24 crystal controlled scanner.

Why do engineers design these circuits with any hysteresis? Basically, hysteresis prevents weak signals from "popping" the squelch open and closed rapidly, which would be very annoying to the listener. A squelch circuit with hysteresis requires a stronger signal to open the squelch than it does to keep it open.

Models cursed with too much hysteresis include the Bearcat 800XLT, Radio Shack PRO-2003, PRO-2004, and others. Don't despair, the fix is simple for most radios. Unfortunately, the Uniden/Bearcat 600XLT and 760XLT series use tiny surface mount components, which makes modification very difficult. I've successfully reduced the squelch hysteresis on other models by replacing a single resistor.

Hysteresis is usually implemented by providing feedback from the squelch gate input to output, through a resistor. The higher the resistor value, the less feedback there is, and less hysteresis. My modification involves replacing the "stock" resistor with a higher value resistor, as identified in the table below.

This article cannot provide step-by-step instructions for each radio. I always encourage radio hobbyists to purchase the service manuals for their equipment. The most useful sections of the manual are the schematics and printed circuit diagrams. Good manuals will also describe the theory of operation and alignment procedures, and contain a complete parts list.

If your radio has too much hysteresis, and is not listed in the table, study the service manual. Motorola MC3357 and MC3359 integrated circuits, which contain IF and squelch circuitry, are popular in scanners. In these receivers,

look for the hysteresis resistor to be connected to these ICs.

Notes |

1. The author cannot furnish modification information for other radios.

2. Don't attempt this, or any other internal modification, unless you are skilled in electronic servicing.

3. Make sure your receiver is disconnected from any power source before opening the cabinet.

Table 1. Squelch Hysteresis Resistor In Selected Receivers |

Squelch Hysteresis Resistor In Selected Receivers		
Receiver Model	Resistor Designation	Factory Value
Radio Shack PRO-24	R35	33K replace with 220K. Located between pins 12 and 14 of MC3357 (IC1)
Radio Shack PRO-2002	R197	47K try 220K.
Radio Shack PRO-2004	R148	47K remove R148 or replace with 220K. On linear board, between pins 12 & 14 of TK10420 (IC2)
Bearcat 220	R75	2.7M may be ok as is

Any conditioning charger will work very well. The discharge circuits bring the battery voltage down to approximatley .6 volt, one should avoid deep discharging the battery to 0 volts, when this happens the battery capacity is drastically reduced (Nicads go through a 'forming' process at the factory and deep discharges undo the benefits of the forming process). I built my own conditioner using hi current silicon diodes to shunt the battery. When the battery low indicator comes up on my scanner I pop the batteries into the discharger to bring everything down to .6 - .7 volts. It won't drop below this because the diode stops conducting below .6 volts. I have noticed a remarkeable improvement in battery capacity between charges and this also eliminates the memory effect (when a cell plateaus at 1v for the duration of its remaining capacity between charges).

Hope this helps.

Andy

The amount of birdies is totally dependent on how well the isolation is between the different stages of the scanner. Triple conversion will have little or no effect on birdies; they are being received because they are internally generated (including all harmonics of the fundamental frequency). I have seen very few if any birdies in my Pro-43, then again, the Pro-43 has a considerable amount of shielding in between the circuits.

If there is a diode or a chip or anything that can be replace or added.
> Also if added so the scanner can get Cell Phone freqs.
If I remember correctly, the Bearcat 210 was one of the earliest of the synthesised desk-top scanners; at a guess it first appeared in 1978 or so. The only mod I am aware of shifts the VHF-Lo coverage from 30-50 MHz to 68-88 MHz for European use. But you have to flip both the logic (fairly easy) and change RF components (not so easy). You then lose the 30-50 but gain the ability to listen to some TV sound channels. No other changes are possible because there is no RF circuitry or logic to support it. Most of the scanner mods available on later models are the re-instatement of facilities blocked in the US but available in other markets.

Your dad should keep his BC210 (which is quite an important machine in the history of scanners) and use it happily on its existing operational range. He should also but himself something newer and more modern - by keeping his BC210 in good condition all these years, he's earned it!

>RG-8 and RG-58.

I aggree that if you going to the trouble of finding the best coax for your application that you should certainly stick to the correct impedance.

But I would offer that impedance is critical for receive only applications but not in the same way. We worry about impedance matching our feed on a transmitter because we don't want reflected power damaging the radios. And because we want as much of our transmitter power to make it to the antenna. But any losses that you experience between the transmitter and antenna would also be present between antenna and the receiver. The idea is to get as much of the power that goes into one end of the coax to come out at the other.

IMO every dB counts when optimizing a receive system.

RE: Cobra phone

I actually have this phone and it works very well. I like the no-antenna design of this phone, it still delivers clearly. However, it helps if you don't put the phone on your shoulder. The price is very reasonable. I would'nt conduct illegal transactions or disclose my cc # over it but it will give you privacy from most of the public (also from those who pick up your conversation on their cordless). If people want to go through the trouble of descrambling your call to gramma, more power to 'em. However, most people (myself included) only use conventional scanners w/out any sort of illegal descrambling device. So...if you think that people within 1000 ft. of your phone 1.Have a scanner 2. Have a descrambling device , feel free to blow cash on 900mhz. Again, this phone cannot not be foiled by just a regular scanner.

As a fairly new member of this group, I wasn't aware that the main intent
of it was to discuss solely the legal aspects of scanning.

My largest kill file by far is for this group (consisting mostly of
repetitive requests for modification information).

Maybe we need to split it up into several groups (no, I'm not volunteering,
I have neither the time nor the knowledge) :

rec.radio.scanner.legal
rec.radio.scanner.frequencies
rec.radio.scanner.equipment (which maybe would not include mods, leading to:
rec.radio.scanner.mods)

The inconsistant, non-precise squelch settings you're finding ARE a characteristic of the 2006- you have one that works, unfortunately, just like it's supposed to. There is a modification that corrects it (makes it much better) but it seems to be a fairly in-depth mod that I don't feel confident enough to tackle (I usually try to tackle most anything! :-), and if it's the task I remember reading complaints about, it does require some hard-to-find components. If you want the mod, I'm sure someone out here will offer it to you- I would but I only have it on paper and it's kinda long.

Think back a little harder. The "war on drugs," which spawned the crazy
property seizure laws we have today, didn't start with the present
administration.

Loss is loss, a decibel is a decibel, whether transmitting or receiving.

I have used my 2500 in San Jose/Sunnyvale, Menlo Park/Atherton area, as well as here in Utah, and have not found the birdies to problem while scanning. Generally, the wider the frequency coverage, the more birdies that the designers can't hide in the gaps!

I agree that people support these unenforcable laws because it probably
does give them a (false) sence or privacy and protection and feel their
privacy has been invaded. These same people will no doubt continue
to GIVE away their privacy by using some type of wireless phone.

Tom

P.S. Someone raised the question of Cell telephones themselves being
illegal because they are capable of receiving cell phone calls. Do
cordless telephones fall into this same category?? Just a thought.

Why not just have one newsgroup. Let's all band together and eliminate alt.radio.scanner. This can be done as follows:

Post the following message to alt.radio.scanner and repeat the message many times on a daily basis:

"If you are posting to alt.radio.scanner, please post to rec.radio.scanner so that we can eliminate alt.radio.scanner and have one scanner newsgroup. Thankyou for your cooperation."

I would appreciate replies and help from anyone and everyone. I am tired of reading two newsgroups for no valid reason!!

3803. Scanning the police chase

Newsgroup: rec.radio.scanner
Date: 1994-10-13 19:48:14 UTC
From: ad225@detroit.freenet.org
Message-ID: <37k2tu$pgs@detroit.freenet.org>
Source record: 267324

In an earlier discussion of cordless phones there was a posting about how police monitored a cordless phone conversation and then arrested a person for marijuana posession based on what they overheard. Here's a story about the other side of the coin, though it has to do with monitoring police scanners.

Earlier this month, Dearborn, Michigan police chased a reckless driver at high rates of speed into Detroit. The car eventually struck another, killing three occupants of the suspect car and the driver of the innocent car he hit.

Attorney Geoffrey Feiger (you've heard of him, he represents Dr. Kevorkian) brought a $20 million suit yesterday against the Dearborn police on behalf of the innocent victim.

The cops maintain they broke the chase off after the car they were after entered Detroit. An off-duty Detroit cop who says he witnessed the accident refutes that contention.

In addition to the suit, Feiger requested an injunction prohibiting Dearborn police from destroying tape recordings of the police radio conversations during the chase. But then he said, even if the Dearborn police "lose" the tapes, he has his evidence because of scanner buffs who tape recorded the chase in their homes and then made those tapes available to him!

Interesting!

: : : I'm confused at your reaction. Listening to cordless phones is already
: : : illegal in CA, so their response is not unreasonable.

: : It's not the illegality of the listening that is really at issue... BUT,

: Earth to Glen . . . :-)
: Your post began "[my press release about cordless phone snooping being
: *outlawed*]"! Sure sounds like illegality being at issue to me.

It about people being screwed becaue they blab on the cordless phone and
haven't a clue that people tune in. Now, whether it is legal or illegal
to tune in, thousands if not millions will. Whether those who tune in
use the information for legal or illegal purposes is another question.
But neither of those are the problem or the issue... but the fact that
people blab too much information on the cordless phones.

The fact that Congress outlawed listening to cordless phones... and the
fact that it will not stop people, particularly those with true criminal
intent is the issue...

For anyone interested...

Attenuation per 100' loss in dB===>

Coax type	25mhz	30mhz	50mhz	150mhz	200mhz	400mhz	800mhz	1000>
hardline*	0.23	0.25	0.35	0.70	0.80	1.30	1.90	2.10+
9913	0.60	0.70	0.90	1.60	1.80	2.10	3.90	4.20+
RG-11/Ufoam	0.60	0.75	1.30	1.60	2.00	3.00	4.00	8.9+
RG-8/U foam	0.80	0.90	1.30	2.10	2.40	3.50	7.90	9.1+
RG-6/U foam	0.90	0.75	1.50	2.50	3.10	4.40	6.90	7.2+
RG-58 most	1.99	2.70	3.30	6.00	8.00	11.5	16.0	21.0+

* 7/8" Hardline (Aluminum Jacket or Heliax type cable..

Figures from ARRL Antenna Book, and from Belden spec sheets. Specs for the RG-58 is from the average of all RG-58 types listed. The main thing is what are you going to monitor. I like mil a/c so 9913 and RG-11/U has the lowest attenuation in the 200-400mhz band If I used RG-58 I would expect a net lose of between 6.20 to 9.40 dB on that band. That is a BIG difference!!! Hardline would be great...But it is tough to work with, like running conduit.

10-4

>telephone conversations from unauthorized surveillance."

This was NOT a late breaking "significant new privacy protection" added to the bill,
rather it was in the bill from the very beginning. Since there is not FEDERAL
RIGHT OF PRIVACY such as those added to many state constitutions, to protect privacy
one needs statutory language to do it. The FBI tried to point out that they were
also curtailing their powers to snoop by allowing this section in the bill
(in reality a few federal courts were just about ready to come down with a ban
on cordless phone snooping by law enforcement).

Just got back from honeymooning on Kauai, and we're glad we took along our PRO-43! (We both enjoy monitoring!) Although there isn't very much traffic (pretty safe place), we *did* have a tsunami warning on Oct. 4th due to an earthquake measuring 8.2 in Japan. They can predict the time of arrival, but not the magnitude of the tsunami - so everyone in coastal areas had to go to a shelter or head inland. Turns out the wave was a huge <g> 18". But it was fun listening to the traffic on the ham bands and civil defense frequencies. Much better than the repetitious drivel on FM radio 8^).

On our way back to the states, while waiting to takeoff from Lihue airport, we monitored the tower and learned that the airport was to be shutdown for 20 minutes for an airshow (they were having an open house) featuring a stunt pilot in a biplane. The advance notice allowed us to snarf a prime viewing spot for what proved to be quite an entertaining display.

On the way _to_ Hawaii from LAX (on Hawaiian Air) I was listening to the scanner *after* we reached cruising altitude. A flight attendant came over and asked (incredulously), "WHAT is THAT?" I told her it was a scanner, capable of receiving - but *not* transmitting. She said she would have to check with the captain, but didn't think I was allowed to use it on the plane. I told her I'd shut it off while she checked. A few minutes later she returned and said that the co-pilot knew what it was and was certain it would do no harm, but that the pilot indicated it was against FAA regulations to use it in flight. No harm - there wasn't any traffic to speak of, anyway!

I picked up the following frequency list from Rat Shack while I was on Kauai (for two bucks #^( )...

I'm new to the world of scanning and am considering purchasing a scanner in the $400 price range. Would prefer a handheld unit or table top model if it would run off of 12 Volts DC.

Any suggestions?

It depends. If you are a participant in the phone call, it is not illegal.
Likewise, if you have the permission of atleast one of the participants in the
call, then you may monitor the call and it still isn't illegal. Only when you
intercept a call that you are not a part of and none of the participants has
given you permission to monitor does it become illegal.

gcue> I'm looking for a scanner that is capable of pl tone scanning.

Yes. Get a Uniden BC-760XLT. Can program PL tones from a list of 38 into each channel as needed.

gcue> I also am trying to find out if there are any scanners capable of
gcue> squelching out until the recieve a preprogrammed pager tone. By pager
gcue> tone, I'm referring to the tones used by Public Safety departments to
gcue> tone out units.

No scanner has built in 2 tone or 5/6 tone pager decoding at this time. I wish they did. You can purchase a 2 tone decoder from Communications Electronics and attach it to the line out or speaker out of the scanner. Operation may be poor at best unless the channel to decode is set as the only channel to monitor or on priority. The first tone is only 1-2 seconds long or less, depending on format, and with the receiver scanning it may miss the first tone and not decode.

gcue> Is the company Plectron still in business??? They used to make single
gcue> freq. monitors that have the capabilities abouve.

Yes. I don't have any info for them. Motorola makes a monitor, Minitor II, which can be carrier squeclch, PL, or 2 tone decode activated. Accessories for scan area available from outside sources.

Another source makes a PC programmble 2 ch. monitor w/scan & priority. PL, carrier or 2 tone decode.

You may look at getting USED monitors from another dept. which has upgraded recently.

>a DDI Box works. The device is intriquing, and although I do not intend
>to go out and spend $400 for one, I'd love to know the principle behind
>its operation.

Each time the tower wants the phone to do something, it sends a chirp of
digital data. This chirp is on the same frequency as the audio during a
conversation. When a phone is not in use it is montoring the control channel.
The DDI box can decode the digital data so that when the tower sends a
command to change to a different cell the box tells your radio what frequency
to change to.

The box does more than that, but that the basic concept.

Introduction to Scanning
by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of the author. Free distribution is encouraged.]

This introduction is intended for people new to the scanning hobby and is oriented to scanning in the USA. It tells where you can buy your first scanner, what features it should have, where to get it repaired if required, how to get frequency information, and mentions a few scanner clubs worth joining.

Why Scanning?

Every day and night, scanner hobbyists are entertained by what they overhear on their radios. Police cars, fire engines, ambulances, armored cars, trains, taxis, airplanes, and buses are all equipped with radios and you can listen to them. You can monitor the local sheriff and fire departments to hear about events "as they happen," before the news reporters hear about them. Hostage dramas, bank robberies, car crashes, chemical spills, tornado sightings are all fair game. In a single afternoon, you can hear a high speed police chase, Drug Enforcement agents on a sting operation, and undercover FBI agents as they stakeout a suspect.

How about listening to a presidential candidate discuss strategy with his advisor from a 415 MHz radiophone in Air Force 1, or a team of G-men protect him while transmitting in the 167 MHz range?

Listen in the 46.61 - 49.97 MHz range to your neighbors deal drugs over their cordless telephone, or as their conversations are picked up and transmitted over the airwaves between 49.67 and 49.99 MHz by their sensitive baby monitor intercom.

Stay ahead of road conditions by listening to highway road crews, snow plows, and traffic helicopter pilots.

Take your scanner to sporting events and listen to race car drivers, football coaches, etc., in the 151, 154, and 468 MHz ranges.

Monitor the everyday hustle and bustle of businesses, from cable TV repair crews tracking down pirate descrambler boxes, to security guards at your nuclear power plant or mall security guards chasing a shoplifter.

You can even listen to the order taker's wireless microphone at the local McDonald's restaurant on 154.6 and 35.02 MHz!

Is Scanning Legal?

In the United States, scanning from your home or at work is perfectly legal in most situations. The Electronic Communications Privacy Act of 1986 made it illegal to listen to mobile phones, common carrier paging, and a few other types of communication, but many scanners cover these frequencies, and it's clear that Americans still listen to whatever they want in the privacy of their own homes despite the ECPA. A new law threatens to outlaw listening | to cordless phones, too. |

It is now illegal for companies to sell recently | manufactured scanners which cover or can be easily modified to cover the cellular phone frequencies, but sales by private individuals will still be allowed.

Speaking of privacy, federal law also requires you to keep what you hear to yourself and not use the information you hear on your scanner for personal gain.

Be aware that several states have laws pertaining to scanning while in your car. Indiana restricts some portable scanners. A few states have enacted their own | laws against listening to cordless phones. You can find out about these restrictions in a 39 page paperback, ANARC Guide to U. S. Monitoring Laws, compiled by Frank Terranella, available for $7.50 from ANARC Publications, P.O. Box 462, Northfield, MN 55057.

What Scanner Should I Buy?

Radio Shack and Uniden (maker of Bearcat, Regency, and Cobra brands) offer a wide choice of scanners. Radio Shack scanners bear the Realistic label but are actually manufactured by both GRE (General Research Electronics) and by Uniden. Personally, I don't recommend many of the AOR brand scanners.

Programmable (synthesized) units have replaced crystal controlled models as they don't require crystals and usually have a keypad that permits you to store frequencies into channels. Programmables are now so cheap it doesn't make sense to buy a crystal unit as your main scanner unless you get it for under $45 or so.

You can get a battery operated hand held scanner, a bigger "base" scanner which is powered from an AC outlet, or a mobile scanner which connects to your auto's electrical system. There are tradeoffs -- base and mobile scanners almost always provide more audio than portables, and portables are usually more prone to interference when connected to outdoor antennas than base models. But when severe weather knocks out the power in your home, there's nothing like having a battery operated scanner to monitor the power utility and police frequencies!

Make sure your first scanner:

1. has a "search" feature, which allows it to search all the frequencies between two frequency limits of your choosing. The lowest cost programmables can't search.
2. covers the 800 MHz band. Usage of the 800 - 950 MHz | band is growing fast and you will miss out on the action unless your scanner covers this band.

If you're not sure whether you'll like scanning, don't want to spend much money, a 16 channel radio will do. In general, the more channels and banks, the better.

Most of the action takes place on frequencies between 30 and 1000 MHz, so don't be misled by scanner models boasting coverage from 3 to 2000 MHz. There's currently not much to monitor in the 1000 - 2000 MHz range.

If you are interested in receiving short wave, that is, signals in the 3 - 30 MHz range, it's best to get a short wave radio specifically designed for that purpose. Although some scanners receive the short wave band, their performance in that range is often poor.

Deluxe scanners can be controlled by a personal computer, although this feature isn't important to many scanner owners.

Currently, the more popular scanners include the Uniden/Bearcat 760XLT (a/k/a 950XLT) and Radio Shack PRO-2006 base/mobiles, and the Uniden/Bearcat 200XLT (a/k/a 205XLT) and Radio Shack PRO-43 portables. A number of owners report problems with the Uniden/Bearcat 8500XLT and 2500XLT and new replacement models are rumored. |

Considered by many as the best scanner ever made, the 400 | channel Radio Shack PRO-2006 has recently been replaced by | the 1000 channel PRO-2035.

Scanner Antennas

All scanners come with a built in antenna, permitting reception up to about 20 miles or so. Outdoor antennas, like the Channel Master 5094A or Antenna Specialists AV-801, can extend reliable reception to 100 miles or more. If you do use an outdoor antenna, be sure to disconnect and ground it during storms and when not in use to avoid a lightning hazard. Discone and ground plane type antennas can be somewhat more prone to lightning strikes because they are not at "DC ground."

Where Can I Buy A Scanner?

Almost every community has at least one Radio Shack store, and you can find scanners there. Discount chain stores like Wal-Mart, K-Mart, Service Merchandise, and Circuit City sell scanners, but carry just a few models. Department stores, like Sears Roebuck and Montgomery Wards, sometimes offer low end scanners, although at high prices.

The best buys on new scanners are from reputable mail order radio dealers, for example:

- Grove Enterprises, 300 S. Highway 64 West, Brasstown, NC 28902. For a free catalog, call (704)837-9200.

- National Tower Company, PO Box 15417, Shawnee Mission, KS 66215. Telephone (913)888-8864.

- Marymac Distributing (Katy, TX) sells Radio Shack scanners at discount, but charges a 20% restocking fee for returned merchandise. Telephone (800)231-3680 and (713)392-0747.

- Scanner World (Albany, NY). Telephone (518)436-9606.

Beware of inflated "shipping and handling" charges and be sure to include these when comparison shopping.

Many ham radio dealers, like Amateur Electronics Supply (Milwaukee, WI, (800)558-0411), also sell scanners.

Used scanners may be found at hamfests, flea markets, garage sales, or listed in the classified advertisement section of your newspaper.

Modifying Your Scanner

If you are handy with a soldering iron, you may be interested in modifying your scanner to add features or enhance its performance. Be warned this usually voids your

warranty. Modification article files can be copied from several ftp sites including the /pub/ham-radio/mods directory at:

ftp.cs.buffalo.edu
garfield.catt.ncsu.edu
oak.oakland.edu (IP address 141.210.10.117)

KD4MOJ maintains a scanner modification server for people without FTP access. You can request a list of scanner modifications by sending electronic mail with the words GET INDEX.TXT to FTPmail@exchange.tlh.fl.us

Scanner Repair Shops

Is your scanner broken? Aside from sending the scanner back to the manufacturer for repair, here are least two companies which repair scanners:

1. Electronic Repair Centers (telephone 708-455-5105) - Several people have been pleased with good repair service from Electronic Repair Centers in Franklin Park, Illinois. Although they are not authorized to perform warranty work, this outfit has been repairing Bearcat scanners for several years. They charge a flat rate of fixing scanners, and shipping is extra. Electronic Repair Centers will fix Regency scanners if they can obtain the parts.

2. G & G Communications (telephone 716-768-8151) - This family owned company repairs scanners and stocks parts for several older models. G & G sometimes buys old scanners, too. They are located at 9247 Glenwood Drive, LeRoy, NY 14482.

Where Can I Obtain Frequency Information?

To avoid chaos, the FCC licenses two-way radio users and assigns them specific frequencies. Groups of frequencies are allocated to specific types of users, so you won't usually find fire departments using the same frequencies as taxi drivers, for example.

Scanner enthusiasts can obtain frequency information from several sources, including books, government microfiche records, or other listeners.

Books: The most convenient source of fire, police, and local government frequencies is the Police Call Radio Guide, published each year in 9 regional volumes by Hollins Radio Data, and sold at Radio Shack and larger book stores.

I also recommend the book, Monitor America, 2nd edition published by SMB Publishing, and available from Grove

Enterprises for about $25. This single edition contains several pages of police, fire, local government, news media, sports, federal government, and commercial broadcast frequencies for all 50 states. It contains detailed communications system profiles and precinct maps for major metropolitan areas. Police and fire radio codes and unit identifiers unique to local agencies are listed for several cities. This differs from Police Call, which gives a more sterile, but uniform treatment of licensees, listing even the smallest of towns.

Uniden has published several regional directories using the "Betty Bearcat" name, although there are much better directories available from Scanner Master (Newton Highlands, MA) for some regions.

The most readily available source of sensitive US government frequencies is still Tom Kneitel's 168 page Top Secret Registry of US Government Radio Frequencies. Published by CRB Research, the 6th edition is available from Grove Enterprises for about $19. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range.

Commercial Magazines: Although national in circulation, local frequency information is sometimes available in Grove's Monitoring Times (tel. 704-837-9200) and Kneitel's sensationalistic Popular Communications, (tel. 516-681-2922). National Scanning Report is a national scanner magazine published bimonthly and is affiliated with Uniden's Bearcat Radio Club. It will likely disappoint experienced scanner hobbyists and is better suited for beginners. The best scanner frequency lists are often found in club publications, not commercial magazines, and are discussed later.

Government Records: Every year, the US Government sells FCC license information, in the form of microfiche, floppy disk, and magnetic tape, to the public through the US Department of Commerce National Technical Information Service (NTIS). The high cost of buying government records limits their appeal to hardcore enthusiasts. You can write for a catalog of FCC Master Frequency Database items to the NTIS, 5285 Port Royal Road, Springfield, VA 22161.

The FCC has an agreement with PerCon (tel. 716-386-6015), a private company, to sell FCC license information to the public on CDROMs. You can buy the full license information for a multi state region or a less detailed license database covering the the entire USA on CDROM for about

$100. The DOS access software is somewhat difficult to use and the frequencies are displayed with annoying leading zeroes.

Grove enterprises sells FCC license information on floppy disks. Disks for each state are sold separately, and the information is basically the same as the FCC "state sort," i.e., transmitter location (state/city), callsign, licensee name, and type of license. Some hobbyists find Grove's DOS access software is easier to use than the PerCon CDROM access software.

Over 15% of the FCC licenses, including many fast food restaurants, contain transmitter latitude and longitude but specify no transmitter city. To determine the location of those transmitters requires using the latitude and longitude information.

I developed a process which produces a color map of FCC licensed and selected FAA transmitter sites in an area, given a center location (latitude/longitude) and a range (in miles). I call this new innovation a RadioMap(TM). It allows you to identify antenna sites (including paging and cellular phone cell sites) and visualize the transmitter locations in your neighborhood, near your office, at an airport, and other places of interest -- from VLF through microwave. Streets, rivers, and ham radio stations are not shown as they would clutter the RadioMap. RadioMap includes key sheets which list frequencies, callsigns, and licensee names. In rural areas, ranges of up to 10 miles are possible, while ranges of 1/2 to 3 miles produce best | results in urban cities.

Currently, I will produce custom color 8-1/2" by 11" | RadioMaps, suitable for framing or laminating, only for areas in Illinois, Indiana, Wisconsin, Michigan, Missouri, New York, Ohio, and Pennsylvania. Send $19.95 for each | color RadioMap, your name, address, and telephone number, along with center location (lat/long or nearest intersection of 2 streets) to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. 708-554-3839 6-10 PM central time.

Do Your Own Frequency Detective Work

When you try listening to a frequency for the first time, you'll want to know who you're hearing.

Although FCC rules require radio users to identify their operations with their assigned call letters, most ignore the regulation. This often makes it difficult to know who is transmitting. Moreover, many radios are now being

placed in service illegally, without first obtaining the required FCC license.

There is a challenge in deriving new spectrum usage information on your own. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

You can approach from two directions:

1. Listen first: Monitor a frequency or frequencies, and try to determine who's transmitting and what purpose the channel serves. Once you identify the user, log the information.

2. Compile first: Take advantage of opportunities, such as examining the frequency label on a guard's radio, or reading the FCC license hanging on the "radio room" wall, to compile frequency lists, then monitor the listed frequencies to confirm that they are really in use. Readers are urged to abide by the rules of good taste and local laws in the quest for frequency information. Don't trespass, wait for an invitation.

Most listeners use a combination of both approaches.

You can examine the FCC license on premise. I have found the actual FCC radio license, complete with frequency assignments, hanging on the walls of places like the mall security office or company guard shack. You can examine the labels on radio equipment. Frequency information is engraved on labels on the back of many walkie-talkies, or inside the battery compartment, like in the Motorola HT220 model. Most pagers have labels on the bottom or inside. Like passwords taped onto terminals, it's not uncommon to find labels embossed with frequencies or call letters glued to the front of base stations.

You can make your own opportunities for eyeing the equipment or take advantage of "open house" events. If information is displayed publicly, then a reasonable person could assume it's not government secret. Hobbyists are urged to exercise a modicum of restraint and good judgement, however.

How Can I Use Equipment
to Uncover New Frequencies?

If you don't know the exact frequency, but have a general idea of the range (e.g. 150 - 152 MHz), use your scanner's "search" mode. Most programmable scanners afford the

ability to search between two frequency limits set by the user. A few models, like the ICOM R7000/R7100, and R1, and older Bearcat 250 and Regency K500, have the ability to automatically store active frequencies found during an unattended search operation.

To find the frequency of a hotel communications system, one fellow installed his Bearcat 250 in his car and parked in the hotel lot, leaving the scanner in the "search and store" mode. He left the antenna disconnected so the scanner would only respond to a transmitter in the immediate vicinity.

Aside from a scanner and antenna, the most useful piece of equipment for sleuthing is a voice actuated (VOX) cassette tape recorder. You don't need a high fidelity model or anything fancy, a Radio Shack CTR-82 will do. It's best to use a shielded, attenuating cable to feed the scanner audio into the recorder rather than relying on the recorder's internal microphone.

VOX recorders allow one to compress a whole day's worth of monitoring onto a single tape. I often leave a recorder "armed" and connected to a scanner at home while I am at the office or doing something else. When call letters are mumbled, I can play and replay the tape until I hear and understand them.

Test equipment can aid in the quest for new frequency information. I've used a spectrum analyzer connected to an outside antenna, and a frequency counter for close-in work.

Are There Any Scanner Clubs?

One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists about frequencies, communication systems, and receiving equipment is more valuable than any pile of magazines.

The world's largest scanner club is the Radio Communications Monitoring Association (RCMA). Founded in 1975, the RCMA is the "first national and international organization of monitor radio listeners." There are several regional chapters which hold regular meetings. Club dues are $24.00 per year, which includes the monthly RCMA Journal, which consists of approximately 95 pages. Although the focus is on VHF and UHF ranges, there is coverage of HF utility stations below 30 MHz.

Inquiries about RCMA membership should be sent to RCMA General Manager, P.O. Box 542, Silverado, CA 92676, USA.

All Ohio Scanner Club

A smaller club is the All Ohio Scanner Club. Its bimonthly publication, The American Scannergram, is about 60 pages long. Although concentrating on Ohio, there is frequency information from other states, and plenty of good product reviews and scanning tips.

Annual dues are $18 and more information is available from:

Dave Marshall, Managing Editor
All Ohio Scanner Club,
50 Villa Road,
Springfield, OH 45503.

AOSC questions can also be sent electronically to:

rccons!aosc_hq@telerama.pgh.pa.us or
dave.marshall@f240.n108.z1.fidonet.org.
FidoNet: 1:108/240.0

AOSC also has a MEMBERS & EDITORS Scanner related echo, AOSCNet, distributed via FTN on 6 BBS systems, and via Internet Mailing list. Rick Christian advises these strict rules for the AOSCNet Scanner Radio Echo (as of 2/1/94):

1. No discussion of cellular modifications or discussions on how to monitor cellular transmission.
2. No discussions on topics which would violate the ECPA '84, TDDRA '93, (18 USCA 2510 et seq.) or Communications Act 1934 & 1984 as amended (47 USCA 705), i.e., decoding/reception of paging, cellular, encrypted stuff, descrambling etc..
3. No Aliases.
4. No discussion of Shortwave or Amateur Radio material (except SAREX).

For info on the ECHO only, contact:

R.E. Christian, AOSC PA/AOSCNet Founder
PO BOX 12763,
Pittsburgh PA 15241-0763.
FAX: 412-831-5860.

Internet: rccons!aosc_pa@telerama.pgh.pa.us
rccons!aoscnet_hq@telerama.pgh.pa.us
rick.christian@f220.n129.z1.fidonet.org
FidoNet: 1:129/220.0

To receive a file of info on the All Ohio Scanner Club via Internet send to: rccons!ftpmail@telerama.pgh.pa.us

In body: get aoscinfo.zip

This will send a UUENCODED info packet to you. The file contains an outline of the material you will find in the American Scannergram, the AOSCNet, and an application for

membership. (Note: This file will not be sent back to *.fidonet.org addresses.)

Chicago Area Radio Monitoring Association

The Chicago Area Radio Monitoring Association (CARMA) is the foremost club for scanner radio hobbyists in the northern Illinois area. CARMA was formed from the Chicago chapter of the Radio Communications Monitoring Association (RCMA), and we have been meeting since the early 1980s.

Many CARMA members are active in ham radio and GMRS, but the club is devoted to scanning and scanners.

Meetings are held on Saturdays at area restaurants, about 6 times a year. Although lunch starts at noon, the meetings begin officially at 1 PM and often run until about 4 PM. You must purchase a lunch since we get the room for free. Meetings consist of a quick review of club business, sometimes a special presentation, and a "round table" discussion/question & answer session. Large quantities of information and frequency lists are often distributed in the form of free handouts. Members sometimes sell radio equipment at the meetings, too.

In addition to regular meetings, there are two CARMA picnic/field days during which members meet at a park, erect antennas, eat, and operate scanners from battery power. CARMA members take organized tours of various communications facilities in the area.

Club meeting dates and times are published in the CARMA newsletter, published 6 times a year. A one year subscription is available by mailing a $10 check, payable to Kim Moran, to:

The Command Post
attn. Kim & Ted Moran
6143 W. Touhy Avenue
Chicago, IL 60646

Many CARMA members participate on the CARMA computer bulletin board, run by Will Sperling. If you have a modem and terminal or computer, you can reach the CARMA BBS by calling (708)852-1292.

Here is a tentative meeting schedule for the remainder of 1994. All meetings will be held on Saturdays at the Destiny Restaurant, 1440 Rand Road, Des Plaines, IL:

October 15
December 10

Bring a notebook and your appetite.

HOW DO YOU FIND THESE SCANNER FREQUENCIES?

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of the author. Free distribution is encouraged.]

I am often asked, "How do you find these frequencies?" Scanner enthusiasts can obtain frequency information from several sources, including books, government microfiche records, or other listeners.

Books

The most convenient source of fire and police frequencies is the Police Call Radio Guide, published each year in 9 regional volumes by Hollins Radio Data, and sold at Radio Shack and larger book stores for under $10. Police Call is basically a computer printout of FCC license information in the fire, police, local government, and conservation services in two lists: by licensee name within state, and by frequency. Later editions have included a few pages of local airport and nonsensitive federal government frequencies.

I highly recommend Richard Barnett's 1992 book, Monitor America, published by Scanner Master Corp., and available from Grove Enterprises for about $25. This second edition is crammed full of police, fire, local government, news media, sports, national park, and commercial broadcast frequencies for all 50 states. The information was compiled mainly from members of the world's largest scanning club, the Radio Communications Monitoring Association (RCMA). Monitor America contains detailed communications system profiles and precinct maps for major metropolitan areas. Police and fire radio codes and unit identifiers unique to local agencies are listed for several cities. This differs from Police Call, which gives a more sterile, but uniform treatment of licensees, listing even the smallest of towns.

Scanner Master also publishes regional frequency guides for Illinois, Florida, Virginia, Massachusetts, New Jersey, and other states.

Beyond Police Call, available from several sources including Radio Shack, covers the business, schools, and other stations not covered by Police Call, its sister publication. One volume covers the entire USA, but no call signs are shown.

Aeronautical frequencies are covered in the Aeronautical Frequency Directory, written by Bob Coburn, W1JJO. Although most of the information is about civilian aviation, Bob included sections on military mid-air refueling and CAP. The second edition is about 400 pages and is available from Official Scanner Guide. The same publisher sells the Maritime Frequency Directory and frequency guides for several New England states. Some of these books are available through Radio Shack, too.

The most readily available source of sensitive US government frequencies is still Tom Kneitel's Top Secret Registry of US Government Radio Frequencies. Published by CRB Research, the 8th edition is available from Grove Enterprises for about $20. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range. Since the US government no longer offers frequency information for its own stations, and has never published sensitive frequencies, most of the information in Kneitel's book has been collected from listeners over the years. It is certainly not complete, nor 100% accurate, but is the best book in print for this difficult to obtain information.

A more accurate, but smaller and less comprehensive book is Midwest Federal Frequency Directory. It was published in 1986, and copies are getting scarce. Copies may still be available for $10 from Scan America.

Magazines

Although national in circulation, local frequency information is sometimes available in Grove's Monitoring Times and Kneitel's sensationalistic Popular Communications.

Government Records

Every year, the US Government sells FCC license information, in the form of microfiche, floppy disk, and magnetic tape, to the public through the US Department of Commerce National Technical Information Service (NTIS).

These lists contain license information for the industrial (e.g. Illinois Armored Car, Pinkerton's Security, Joe's Towing, etc.), highway maintenance, commercial broadcast, aviation, common carrier, and maritime services, as well as for police and fire. For more info call NTIS at 703-487-4630.

Microfiche is not for the casual hobbyist, but rather for the ardent listener, who can easily spend a few hundred dollars for the fiche, not including the price of a microfiche reader.

Back in "the good old days," Grove Enterprises sold copies of some FCC microfiche files, and this was much cheaper than buying directly from NTIS. Grove no longer sells microfiche, but sells the information on PC floppy disks for each state instead.

The FCC has an agreement with PerCon (tel. 716-386-6015), a private company, to sell FCC license information to the public on both floppy disks and CDROMs. You can buy the full license information for a multi state region or a less detailed license database covering the the entire USA on CDROM for about $100. The DOS access software is somewhat difficult to use and the frequencies are displayed with annoying leading zeroes.

Companies have appeared which are "plugged into" the FCC licensing system and they sell computer time allowing on-line file access. They also sell paper copies of FCC information. Washington Radio Reports is one example. A monthly publication, it lists license applications made to the FCC. A few members of my scanner club subscribe and share the information with me.

Over 15% of the FCC licenses, including many fast food restaurants, contain transmitter latitude and longitude but specify no transmitter city. To determine the location of those transmitters requires using the latitude and longitude information.

I developed a process which produces a color map of FCC licensed and selected FAA transmitter sites in an area, given a center location (latitude/longitude) and a range (in miles). I call this new innovation a RadioMap(TM). It allows you to identify antenna sites (including paging and cellular phone cell sites) and visualize the transmitter locations in your neighborhood, near your office, at an airport, and other places of interest -- from VLF through microwave. Streets, rivers, and ham radio stations are not shown as they would clutter the RadioMap. RadioMap includes key sheets which list frequencies, callsigns, and licensee names. In rural areas, ranges of up to 10 miles

are possible, while ranges of 1/2 to 3 miles produce best | results in urban cities.

Currently, I will produce custom color 8-1/2" by 11" | RadioMaps, suitable for framing or laminating, only for areas in Illinois, Indiana, Wisconsin, Michigan, Missouri, New York, Ohio, and Pennsylvania. Send $19.95 for each | color RadioMap, your name, address, and telephone number, along with center location (lat/long or nearest intersection of 2 streets) to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. 708-554-3839 6-10 PM central time.

Federal Radio Stations - Not Licensed by FCC

Since federal government radio stations are not licensed by the FCC, they are not listed in FCC microfiche. In 1981, a group of 60 radio hobbyists split a $1300 fee, and obtained 80 microfiche cards of 'sanitized' information about federal government radio stations under the Freedom of Information Act (FOIA)1. Only 12 of the 21 information fields for each station were furnished. Fields like "Remarks", which indicate the exact usage of a channel (e.g. "Sky Marshall's Net"), and "Bureau", indicating agency subdivision (e.g. TAC within the USAF), were withheld. These 80 pages of microfiche were sold by Grove Enterprises for $25, but are no longer available from that source. Private entrepreneurs have been known to ask $125 or more for a set! In a step backward, the US Government insists it will no longer release this type of information - it is now 'classified'2.

For a reason unknown to this author, the government released a 1984 vintage set of frequencies allocated to the FAA. Perhaps this was a mistake, because the information is marked 'unclassified', but all fields are furnished, including some which indicate security related usage. Grove sold this set of 33 microfiche cards for about $13.

Two way radio equipment formerly used by the armed forces often appears for sale at hamfests. Less often, Secret Service and FBI radios appear there from time to time, too. When you see such equipment, look over the radio for a frequency label and write down the frequencies stamped on the crystals or channel elements. Make note of any service or property tags which specify the agency or military base which used the equipment.

Radio Clubs

One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists

about frequencies, communication systems, and receiving equipment is more valuable than a pile of magazines.

Since the early 1960s, I had been an amateur radio operator, and belonged to amateur radio clubs, but I never realized there were any scanner clubs! In 1983, I joined the world's largest scanner club, the Radio Communications Monitoring Association (RCMA).

Founded in 1975, the RCMA is the "first national and international organization of monitor radio listeners." There are several regional chapters which hold regular meetings. Club dues are collected annually, which covers a monthly newsletter, the RCMA Scanner Journal, about 95 pages long. Although the focus is on VHF and UHF ranges, there is coverage of HF utility stations below 30 MHz. A recent liberalization of club policy now permits the printing of most federal law enforcement frequencies, e.g., Secret Service, FBI, Customs, and DEA.

Inquiries about RCMA membership should be sent to:

RCMA General Manager
P.O. Box 542
Silverado, CA 92676
USA

Another club which prints sensitive federal frequencies is the All Ohio Scanner Club. I enjoy its bimonthly publication, The American Scannergram, which is about 60 pages long. Although concentrating on Ohio, there is frequency information from other states, and plenty of product reviews and scanning tips.

More information is available from:

All Ohio Scanner Club
50 Villa Road
Springfield, OH 45503

Do Your Own Sleuthing

The real challenge is deriving new spectrum usage information. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

More about sleuthing will be discussed in Part II of this article.

HOW DO YOU FIND THESE SCANNER FREQUENCIES?
Part 2: Sleuthing

by Bob Parnass, AJ9S

Part I of this series discussed how scanner enthusiasts can obtain frequency information from books, government microfiche records, or other listeners. This installment discusses digging up new frequencies on your own.

Do Your Own Sleuthing

There is a challenge in deriving new spectrum usage information on your own. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

You can approach from two directions:

1. Listen first: Monitor a frequency or frequencies, and determine who's transmitting and what purpose the channel serves. Once you identify the user, log the information.

2. Compile first: Take advantage of opportunities, such as examining the frequency label on a guard's radio, or reading the FCC license hanging on the "radio room" wall, to compile frequency lists, then monitor the listed frequencies to confirm that they are really in use. Readers are urged to abide by the rules of good taste and local laws in the quest for frequency information. Don't trespass, wait for an invitation.

Most listeners use a combination of both approaches.

What Makes Station Identification Difficult?

In most instances, FCC rules require radio users to identify their operations with FCC assigned call letters. Police and fire departments, especially those with trained radio dispatchers, seem particularly conscientious about station identification. Like commercial broadcasters, many of these stations identify on the hour and the half hour.

Some repeater stations have Morse code identification circuits which transmit call letters on a periodic basis, insuring compliance with FCC rules.

On the other hand, over 75% the industrial radio stations monitored within the last year ignore the FCC regulation, making it difficult for a listener to identify a station. Some stations may operate for years using the nondescriptive "base to mobile 2" or "Joe to base" protocol. One rung up the hierarchy are stations that identify using something like "Acme base to 107", giving the listener a clue for his log. If call letters are

given, they are often rendered unintelligible by operators who fail to enunciate. The failure to identify is more likely due to sloppiness, rather than any attempt to hide station identity.

While not regulated by the FCC, federal government radio stations vary in the extent to which they identify their transmissions. Some federal stations do not have call letters. A nearby paging transmitter periodically transmits a voice recording announcing, "This is the Army Joliet Ammunition Plant." What more could a listener ask for?

Aside from a scanner and antenna, the most useful piece of equipment for sleuthing is a voice actuated (VOX) cassette tape recorder. You don't need a high fidelity model or anything fancy. I use two modified Radio Shack CTR-75 recorders, a discontinued model.

VOX recorders allow one to compress a whole day's worth of monitoring onto a single tape. I often leave a recorder "armed" and connected to a scanner at home while I am at the office or doing something else. When call letters are mumbled, I can play and replay the tape until I hear and understand them.

The following examples illustrate techniques I've used to derive new frequency information.

Examine the FCC License on Premise

I have found the actual FCC radio license, complete with frequency assignments, hanging on the walls of places like the Bell Labs security office and the guard shack at Waste Management's Greene Valley Landfill in Naperville.

Examine the Labels on Radio Equipment

Frequency information is engraved on labels on the back of many walkie-talkies, or inside the battery compartment, like in the Motorola HT220 model. Most pagers have labels on the bottom or inside. Like passwords taped onto terminals, it's not uncommon to find Dymo or P-Touch tape labels embossed with frequencies or call letters glued to the front of base stations.

You can make your own opportunities for eyeing the equipment or take advantage of "open house" events. If information is displayed publicly, then a reasonable person could assume it's not government secret.

- At the annual Glenview Naval Air Station open house, I examined a military manpack radio being used by

dispensary paramedics. The radio's tuning dial was set at 34.15 MHz.

- The Illinois Army National Guard displayed two armored personnel carriers at the local county fair, each equipped with VHF-FM and HF-SSB transceivers.

In addition to a tuning control (VFO), the VHF-FM radio had a set of channel select pushbuttons, much like those in a car radio. I asked a guardsman a few questions about the radio, and he demonstrated the channel preset feature. A panel above the channel pushbuttons was labeled with the frequencies: 32.055, 34.45, 35.35, 40.55, and 40.60 MHz.

- An Army National Guard UH1 helicopter was displayed at the Marseilles armory "open house". The public was permitted to climb aboard, and observe the instrumentation and radio gear. A channel plate on the instrument cluster listed over a dozen frequencies.

Hobbyists are urged to exercise a modicum of restraint and good judgement. In New Jersey, a radio technician/hobbyist called to service a transmitter in a county building, noticed a new unattended repeater installation in the same room. Being curious about what frequency this repeater was on, he opened the access door to copy the frequencies from the radio's crystals. It turns out that this radio belonged to the US Secret Service, and opening the access door could have activated a "tamper alarm"!

The tech was skating on thin ice. He had nobody's permission to tamper with that equipment.

Another source of frequency information is as close as your nearest Radio Shack store. Some Radio Shack stores make a local frequency list available to assist their scanner customers. Be sure to ask. Stores located in shopping malls almost always know the mall security frequencies. I often check the frequencies programmed into the floor model scanners, too.

Equipment to Determine Frequency Usage

If you don't know the exact frequency, but have a general idea of the range (e.g. 150 - 152 MHz), use your scanner's "search" mode. Most programmable scanners afford the ability to search between two frequency limits set by the user. Some models, including the Radio Shack PRO-2035, | ICOM R7000/R7100, Bearcat 2500XLT, and Bearcat 250, have the ability to automatically store active frequencies found during an unattended search operation.

To find the frequency of a hotel communications system, one fellow installed his Bearcat 250 in his car and parked in the hotel lot, leaving the scanner in the "search and store" mode. He left the antenna disconnected so the scanner would only respond to a transmitter in the immediate vicinity.

Test equipment can aid in the quest for new frequency information. I've used a spectrum analyzer connected to an outside antenna, and a frequency counter for close-in work.

How Can I Determine To Whom I'm Listening? - An Example

While scanning the industrial frequencies in the 150 MHz range, a van driver was overheard communicating with "base" while driving around my town. The stations involved never used FCC call signs -- this would have made life a lot easier for me, and legal for them! (one may use FCC license microfiche, described in Part I of this article, to identify stations using call letters.) Transmissions were short and infrequent, so it was decided to tape record all transmissions on this frequency for several days to determine the station's identity.

During daylight hours, a modified Regency K500 scanner was left tuned to the target frequency, connected to a cheap tape recorder through a home built interface. Using a carrier operated relay, the tape interface supplied power to the recorder only during radio transmissions, so a day's worth of traffic could be compressed into a 45 minute tape.

Each day, the tape was played back and notes on names, locations, and activities mentioned during the day's transmissions were taken. The van driver appeared to be making daily stops at a local bank and two shopping malls. A Walgreen's store seemed to be the only stop at one mall. A few times, "base" ordered the van "back to the Training Center." There were frequent references to "guests checking out", "dropping a guest off", and "instructor[s] missing a class". At times, "base" spoke with "security", who must have been using a walkie-talkie as his signals weren't strong enough to hear.

Was this a hotel? Calls to the three local hotels revealed that none provides shuttle bus service to the shopping malls. A call to the Walgreen's, inquiring about bus service to the store, drew another blank. During my shopping trips, I began to pay closer attention to vans with antennas driving through the parking lots.

I was leaving the mall one day, when a week's effort paid off. A maroon and white van, equipped with a VHF-Hi

antenna, was dropping shoppers off at Walgreen's. A sign on the van's door read:

XYZ Central Training Center (XYZ is a pseudonym for the actual licensee name.)
Lisle, Illinois

I watched the driver pick up a microphone, and listened to him on my portable scanner checking back with his "base".

All the pieces fit: the "guests", the "classes", the "instructors". Mystery solved; I had been monitoring the customer training center for a large computer manufacturer. The training center has hotel rooms and dining facilities to accommodate students from out of state. As a convenience, shuttle van service is provided to local shopping malls.

Summary

Through books, government records, and radio clubs, scanner listeners can make use of frequency information compiled by others. Two-way radio users often fail to identify their transmissions properly, making it more difficult for listeners to know who they are monitoring. By examining radio equipment labeling, and monitoring and taping transmissions, scanner enthusiasts can unearth new information.

BUYING A USED SCANNER RADIO

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of the author. Free distribution is encouraged.]

Anybody with enough money can buy a brand new scanner, but you can save lots of money if you get a good deal on a used scanner. Hamfests are probably the best place to find used radios, but you must be familiar with the equipment. Hamfests are repleat with older radios you won't see in today's catalogs.

At last count, there were over 70 scanners and monitor receivers of various brands in my collection. I purchase most of my receivers at hamfests or horsetrade with other radio hobbyists. This article describes a few of the FM receivers in my collection, and is not meant to be complete.

A Used Scanner May be a Broken Scanner

Getting a bargain is not without some risk. I have had sellers look me square in the eye and tell me their radio worked fine -- when it really didn't.

Buying a used portable scanner is riskier than buying a mobile or base model. Portable scanners are subject to more physical abuse and many have been dropped. If a radio has been dropped, the laws of probability dictate that the first point of impact was probably a corner, so be sure to examine each corner for evidence of trauma.

Scanners used in mobile service are subject to vibration, dust, and temperature extremes. This shouldn't dissuade you from buying a used mobile scanner, but be aware of possible complications.

You should have some recourse if the radio you buy turns out to be defective.

If you can't fix the radio yourself, you can pay to have the manufacturer or a service clinic repair it for you. Several people have been pleased with Electronic Repair Center, in Franklin Park, IL, which repairs scanners for a flat fee. Call them at (708)455-5105 to find out their current rates. G & G Communications (telephone 716-768-8151) is another scanner repair company. This family owned company repairs scanners and stocks parts for several older models. They are located at 9247 Glenwood Drive, LeRoy, NY 14482.

Evolution of the Scanner

It helps to understand some scanner history before shopping for a used scanner. You will likely see radios from many vintages at a hamfest, and should avoid buying early units unless you are a scanner collector.

One of the earliest ancestors to the scanner was the converter. Manufactured by Tompkins (Tuneaverter), Petersen, Bearcat (Lil Tiger), Midland, and others, converters were made to operate in conjunction with AM radios. Then came wide band monitor receivers, in both tunable and crystal control models, like the Radio Shack PRO-2B. Truthfully, converters and tuneable FM receivers are interesting but don't work well by today's standards.

While tuneable receivers were in vogue, solid state technologies supplanted tubes. Better performing, narrow band crystal controlled units, like the Sonar FR-105, followed. These units did not scan, rather channel selection was accomplished using a simple rotary switch. Sonar even made a 24 channel unit, model FR-2513, in which crystals were held in a rotary "turret."

The earliest scanners, like the 1968 vintage Bearcat BCH, | BCL, and BCU models, did not provide individual channel | lockout capability. Electra didn't use the term "scanner" | and instead called these innovative radios "business | receivers." Other models, like the SBE Sentinel, employed | a "Channel 1 Bypass" switch so a user could lockout channel 1.

The first scanners came in single band models, followed by multiband models. As two-way radio users started to populate the 450 - 470 MHz band, consumers were forced to pay a premium for UHF scanner coverage. Some multiband scanners, like the Electra's Bearcat III, required an optional circuit board for each band.

There were scanner mutations, designs which never evolved -- odd combinations of AM broadcast receivers with VHF-FM receive capability, like the flamboyant turquoise Sonar

Sentry FR-103 portables, Electra's Jolly Roger, and GE's Surveyor series. Lafayette Radio Electronics offered a few CB transceivers with VHF receiver capability. These poor performers didn't interest consumers of that era and you should avoid these models unless you are a scanner collector.

The first programmable (crystal-less) scanners were difficult to program. Users had to look up frequencies in a code book and tediously program the information into the scanner in binary form. Some models, like the Bearcat BC-101, Radio Shack COMP 100, and Tennelec MCP-1, resembled Altair or PDP-8 computers, with a row of 16 or so toggle switches. Instead of toggle switches, the Regency WHAMO-10 was programmed by breaking teeth from metal combs. The SBE Optiscan (and its Sears clone) required poking a series of holes in plastic cards which were then inserted into a slot on the front panel.

Keyboard Programmable Scanners

Both Bearcat and Regency, as well as Radio Shack offer some good models. I would avoid the Bearcat 100, and scanners made by AOR, JIL, Fox, Tennelec, and Robyn.

Scanner features often differ not only by model but by manufacturer. For instance, most Radio Shack and Bearcat programmables allow enable/disable of the delay function on a per-channel basis. Older Regency units permit the delay to be enabled/disabled only globally, that is, for all the channels at one time.

Radio Shack scanners contain a reasonable number of features. All the older Radio Shack scanners were made by General Research Electronics (GRE). Uniden began making scanner models for Radio Shack in the late 1980s, and now supplies about half the Radio Shack scanners. The older GRE-made models scan a bit slowly and have a higher level of synthesizer noise. Most have too much hysteresis in the operation of the squelch control, but this can be fixed completely by replacing one resistor. Good, detailed shop manuals are available for Radio Shack units for $5 - $12.

In the name of cost cutting, some models have done away with the concept of a "channel bank", i.e. the ability to select/deselect a group of channels at a time. The bank concept was a good one. It may be inconvenient to operate a 30 channel scanner without banks (e.g. Regency MX3000, HX1000) if you operate the way many scanner hobbyists do.

If you want to buy an American-made scanner, you will have to buy an old model. A few years ago, the Regency and

Bearcat scanner lines were purchased by Uniden, a Japanese company, and production was moved to Asia.

My favorite VHF/UHF receivers are the 300 channel Radio Shack PRO-2004, the newer 400 channel PRO-2005 and PRO-2006, and the ICOM R7000 and R7100. The ICOM models are more "communications receiver" than a conventional scanner.

Other favorites include the Bearcat 300 and 760XLT, Regency M400, and the Regency K500 (predates the M400), all of which include a "service search" feature.

For portable use, I prefer the Radio Shack PRO-43 and Uniden/Bearcat 200XLT.

Obtaining Crystals

If you do purchase a crystal controlled scanner or monitor receiver, you will probably want to buy more crystals to cover local frequencies.

Scanner crystals may be ordered from your local Radio Shack store or from one of the companies below. Be sure to specify the operating frequency you want and the brand and model of scanner.

Some companies may ask you to send a schematic of the scanner or require more detailed information, like series or parallel resonance, load capacitance, etc.

ICOM

R-7000: At about $1000, this was once the top VHF/UHF receiver. 99 channel, multi mode coverage from 25-2000 MHz with a small gap at 1000-1025 MHz. Memory can be expanded to 198 channels by adding simple switch to pin 19 of memory IC8. Tuning knob lets you tune through parts of the spectrum much easier than using the SEARCH mode on conventional scanners. Selectable USB/LSB allows reception of new amplitude compandored sideband (ACSB) stations. S-meter doubles as discriminator meter to aid tuning. Useful search and store feature, reminiscent of the the Bearcat 250, searches between 2 limits and automatically stores new frequencies into channels 80-99. Audio and control interface for tape recorder. Noisy relay, activated when the receiver is tuned to frequencies above 520 MHz. Searches and scans slowly but can be sped up to about 12 cps by adding a resistor. Too big for permanent mobile use, but too nice to leave alone in the car. If you don't want to spend $1000, get a Radio Shack PRO-2004/5/6 instead.

R-7100: At about $1300, this is the Cadillac of VHF/UHF receivers. 900 channel, multi mode continuous coverage from 25-2000 MHz. The radio RF/IF/AF portions of the R7100 are similar to the older R7000, but the R7100 is constructed using surface mount parts. Both the R7000 and R7100 are much more immune to intermod than the Uniden/Bearcat 760XLT and the portable PRO-43. The firmware in the R7100 is much more sophisticated. 9 banks of 100 channels. Further, you can associate each channel with 1 of 10 groups. Many possible ways to scan. 10 pairs of search limits. Search and store ("memory write") scan mode lets you store 100 frequencies instead of the 20 in R7000. Another R7100 improvement is that you can program up to 100 channels for the R7100 to skip while searching. R7100 has 2 VFOs ("windows"). Both the R7000 and R7100 scan slowly compared with PRO-2004 and PRO-2006, and that's a drawback. Both the R7100 and R7000 employ a noisy relay, activated when the receiver is tuned to frequencies above 520 MHz. Scanning a mixture of VHF and UHF frequencies serenades the Icom user with a very annoying clickety-clack, clickety-clack!

UNIDEN/Bearcat and Electra/Bearcat

Bearcat III (Electra): 8 channel crystal controlled scanner. Requires optional front-end circuit board for VHF-low, VHF-high, and UHF bands, but only 2 boards can be

installed within the radio at the same time. Two crystal filters. No aircraft band coverage nor rescan delay. Front mount speaker sounds good. Strong local oscillator radiation often causes interference with other scanners in the same house.

Bearcat IV (Electra): 8 channel crystal controlled scanner. Newer version of Bearcat III but has better IF filtering and contains front-end circuitry for VHF-low, VHF-high, and UHF bands. No aircraft band coverage. Three crystal filters. Front mount speaker sounds good. No rescan delay.

Bearcat 12 (Electra): One of the last decent crystal controlled scanners. 10 channels. Variable scan speed up to 20 ch/sec. Single delay on/off switch. Front mount speaker sounds good. Manual contains schematic. Selectivity is poorer than programmable models, like the 300, allowing adjacent channel interference. Covers VHF-low, VHF-high, and UHF bands but no aircraft band coverage. Crystal positions must be arranged by band.

BC101 (Electra): First Bearcat synthesized unit. 16 channels, no priority. Frequency programmed in binary by setting toggle switches on front panel after looking up code in code book. No frequency readout. Uses custom IC for CPU, now discontinued, so factory authorized service is no longer available. I have four of these units. DC operation requires optional mobile power supply.

BC100 (Electra): First programmable portable scanner. Be prepared for at least one repair in the first year. Early units, with threaded antenna connector, have high frequency of repair, particularly LCD readout, keyboard, and battery holder. No battery backup. Poor case design in early units caused battery to disconnect from radio, resetting microprocessor and clearing memories. No priority channel or aircraft band. Some people swear by the BC100, others swear at them.

BC220 (Electra): 20 channels. Reasonable number of features but 20 channels doesn't seem enough. Service Search for Marine and Aircraft. LED readout. Good scanner, but tinny audio.

BC20/20 (Electra): A BC220 but with 40 channels. A maximum of 20 channels can be scanned at one time. Reasonable number of features. Service Search for Marine and Aircraft. LED readout. Good scanner, but tinny audio.

BC250 (Electra): 50 channel model, rich in features, but lacks aircraft band and 144-146 MHz. Search and Store

feature extremely useful for finding federal frequencies. Clock. High frequency of repair. Power transistors not heat sinked adequately, causing heat damage to surrounding components and circuit board. Failure of Q204 on the feature board known to cause odd display readings. Digital circuitry very sensitive to glitches caused by static and AC line spikes. Avoid 1978 or earlier vintage units. All BC250s use custom ICs (e.g., IC6, a divider chip, mfd. by Exar), which are now discontinued, so factory service is no longer available from Uniden.

BC260 (Electra): Super heavy duty metal cabinetry and lit controls, aimed at mobile use for firemen, police, etc. Few frills, only 16 channels, no aircraft, but generous coverage of federal bands omitted in the older Bearcat scanners. Good sensitivity. Lots of audio. Good internal construction. Backlit keyboard allows operation in the dark, but the keyboards on some units require high pressure to operate. Brightness control for display and keyboard, but multiplexor circuitry for vacuum fluorescent display produces audible whine which may be annoying in a quiet room. Backlighting may fail in some units due to poor contact on connector used to fasten light panel to front circuit board. 9 volt regulator transistor Q28 (TIP29) may fail, causing blank display while leaving audio intact. Method of connecting an external speaker is awkward.

BC300 (Electra): 50 channel top of the line scanner. Service Search feature contains 11 ROM banks of preprogrammed channels. Switching power supply failure noted in early units due to insufficient capacitance - component value was changed in newer units. Schematics show at least 100 components changed between earliest and later units. Preset squelch pot, mounted internally on circuit board, misadjusted in new units - adjustment usually required after burn-in period. Good sensitivity. Built in clock. I leave it on 24 hours a day. This is a favorite.

BC350 (Electra): 50 channels in 5 banks. Includes aircraft. Used to be Bearcat's top of the line, overpriced scanner but never very popular. Dual use keyboard and display allowed 8 text characters to be associated with each channel, a feature clumsily implemented, and awkward to use. Units plagued with various hardware problems including bad memory ICs and short life power transformers. Firmware bugs without cures. The BC300 is a much better scanner than the BC350, and at a lower price.

800XLT (Uniden): 40 channels in two banks. Covers 806-912 MHz, as well as of vhf, uhf, and aircraft bands. Receives

10 meter fm and all of 6 meters, as well as federal portions of vhf and uhf bands. Fewer birdies on vhf-lo band than other scanners. Scans and searches very fast. Clean, robust audio output. Extremely sensitive, but very prone to overload by strong signals when connected to outdoor antenna. Too much play (hysteresis) in squelch adjustment - can be improved by changing one resistor. Positive terminal in memory backup battery holder installed backwards in early units, allowing memory loss when scanner unplugged from AC outlet. Tunes in increments of 12.5 KHz on 800 MHz band, whereas cellular telephones are on 30 KHz channels.

BC100XLT (Uniden): Excellent 100 channel portable with 10 priority channels. Unique feature tells whether a given frequency has already been memorized. Generous coverage of conventional bands, including commercial aircraft, but no 800 MHz. Decent leather-like case. Slide-on 550 mAH NiCd battery pack.

BC200XLT (Uniden): Excellent 200 channel version of BC100XLT portable scanner but includes 800 MHz band. 10 priority channels. Unique feature tells whether a given frequency has already been memorized. Decent leather-like case. Slide-on NiCd battery pack.

Regency

TMR series: First generation crystal scanners. Come in all varieties of band coverage. Models with both UHF and VHF bands must use separate antennas for each band (disadvantage in mobile installations, but can be overcome by connecting two front ends via a capacitor). Not sensitive enough to cover the entire 30 - 50 MHz range in a single model. There three versions of VHF-low band coverage depending on the part of the 30 - 50 MHz band covered (LL, LM. and LH). TMR scanners use unsocketed incandescent bulbs for channel indicators which require periodic replacement. Easy to crystal: Radio Shack crystals work well. TMRs usually $2 and up at hamfests, often in poor condition. Don't pay more than $50, even if mint. Front ends must be tuned for selected portions within the bands for best sensitivity. Wide IF selectivity troublesome in urban/suburban areas. Primitive digital scanning circuitry may become confused at times. but power off/on restores sanity. Replace aging capacitors in the scanning circuits. You can find a TMR8H eight channel high band unit most often.

TME series: The base versions of the TMR models. Both the TME and TMR models share many common circuits but the base versions contain speakers mounted on the front panel. The

most common TME model is the TME8 H/LM eight channel dual band scanner in a metal cabinet with wood coloring.

ACTR series: Replaced the Regency TMR units. By the time Regency made the ACTR units, they no longer offered different models for different parts of the 30 - 50 MHz band. Look for the later ACT series, e.g., ACTR-106 (10 channel tri band) or ACTR20/6 (20 channel tri band), used light emitting diodes for channel indicators instead of incandescent bulbs. Available in 1 to 20 channel models - most are multi band receivers. Somewhat wide selectivity. Not all that bad a deal if cheap.

ACTE series: The base versions of the ACTR series. The ACTE and ACTR circuitry is similar, although the base versions contain speakers mounted on the front panel. The most common ACTE model is the ACTE8 H/L eight channel dual band scanner in a black metal cabinet.

WHAMO-10: Regency's first synthesized scanner. Appearance more like a crystal scanner, with a single LED per channel. User has to break off teeth on a metal 'comb' for each channel according to a code book. External frequency control unit DFS-5K optional. UHF VCO reference oscillator drifts on some units. Soldered sheet metal shields around some circuitry make access to some components difficult for servicing. Comb sockets prone to bad connections after moderate use. Not recommended due to maintenance difficulties.

K500: Nice wood-like cabinet. 40 channel model with every feature Regency could dream of in one scanner, except aircraft band. Idle tone bypass feature for mobile phone stations works about 50% of the time. Weather alert feature. Service Search in several banks. Search and Store facility not implemented as well as BC250, but better than none. Built in clock when radio off or in manual mode. Can be programmed out of band. Reasonable performance, but sensitivity could be better. Spring contacts on membrane keyboard may need soldering after prolonged use.

K100: Bare bones version of the K500. 10 channels, no priority feature. Same wood-like cabinet and reasonable performance as K500. Spring contacts on membrane keyboard may need soldering after prolonged use.

M400: 30 channel replacement for K500. Service Search, but no aircraft. Easily programmable out of band. Built in clock when radio off or in manual mode. Backlit keyboard good for night viewing and mobile use but generates RFI into nearby SW receivers. A favorite.

MX3000: 30 channel replacement for M400, but basic features only. Nice lit keyboard, but may cause RFI into nearby SW receivers. Easily programmable out of band, but no aircraft. All 30 channels are in a single bank, and lack of direct channel access make this model more difficult to operate. Good first scanner.

M100: 10 channel unit. Same as MX3000 except different color and fewer channels. Nicely lit keyboard, but may cause RFI into nearby SW receivers.

HX1000: Good, fairly rugged, 30 channel handheld synthesized unit. Generous out of band coverage but no AM aircraft coverage. Built by Azden. Very sensitive on UHF, but annoying audio hiss leaks through speaker when squelched. Belt clip chintzy, but can be directly replaced with better clip from Kenwood TR2600A. Like the MX3000, all 30 channels are in a single bank, and lack of direct channel access make this model more difficult to operate. Low discount price makes this best choice for programmable portable.

HX650/H604: 6 channel crystal portable. Likely made by Sanyo. Same as Fannon and Bearcat Thin Scan units, (except that Bearcat has 10.8 MHz IF frequency, and is harder to get crystals for), but scans faster. Small size and common crystals (available at Radio Shack), make this 1st choice for bare bones portable scanner.

Radio Shack

PRO2004: Top of the line, wide band scanner for 1987. After a diode is cut, enjoy continuous coverage from 25-520 and 760-1300 MHz, AM, NBFM, and WBFM. Has 300 channels in 10 banks of 30, backed up by conventional 9 volt alkaline battery. Any channel can be designated the priority channel. Scans and searches fast. Lots of well designed features, like 10 pairs of search limits, Lockout Review, default search increment and emission mode. Sound Squelch allows skipping dead carriers during search or scan. Metal cabinet, good internal construction and shielding, but no mobile mounting bracket or DC power cord. Soft touch membrane keyboard. Good sensitivity and selectivity. Very good radio.

PRO2005: Radio Shack's top of the line scanner for 1989 and scanner of choice. Essentially a size reduced PRO-2004 with surface mount components and 400 channels. Some people think the small knobs, smaller display, and plastic cabinet are a setback from the 2004. The smaller size, real rubber keyboard, and vertical front panel make it easer to use mobile, although there is no mobile mounting bracket available and the keyboard is not backlit. More

sensitive than the PRO-2004 but 800 MHz signals leak through into the commercial aero band. Highly recommended.

PRO2006: Radio Shack's 1994 top of the line scanner. Essentially the same as PRO-2005 but scans faster. Probably the best scanner made to date. Highly recommended.

PRO34: Portable scanner with 200 channels and 800 MHz coverage. Ten "monitor" channels. Operates from AA cells. Slow scanning, low audio output, and chintzy plastic case detract from an otherwise good performance. No decent leather case available from Radio Shack. If you need a portable with 800 MHz, get a Bearcat 200XLT. If you can't get a 200XLT, get a PRO-34.

PRO2021: Base/mobile scanner. 200 channels in 10 banks, LCD display and raised rubber keys. Lots of memory but scans too slowly and lacks 800 MHz. Ten "monitor" channels. Radio Shack seemed to have an overstock of 2021s as they were on sale for such a long time. Close out price dipped to about $200, which made it a nice scanner for beginners.

PRO2001: Early, single bank 16 channel programmable. Reasonable coverage of the 3 traditional bands, minus aircraft band. LED digital display as well as an LED per channel. Mechanical lockout switch for each channel. Delay is either on or off for all channels at a time. High synthesizer noise level. Troublesome plated through holes on digital board in some units renders radio virtually unfixable. Could never get mine to work more than a few days in a row; always another bad connection. Some owners have no trouble.

PRO52: 8 channel VHF-Lo/Hi base unit. No UHF band or provision for mobile operation. Good little scanner despite limited frequency coverage and Spartan lack of frills. Crisp squelch action and good audio, helped by a front mounted, vertical speaker.

PRO2003: Radio Shack's 1986 top of line. 50 channels + 10 FM commercial broadcast band channels. Includes aircraft. Good frequency coverage and functionality, but at a high price. Poor human engineering: difficult to read keyboard makes the PRO2003 hard to operate unless in a well lit room. Keyboard label coloring improved on newer units. Rather slow scan rate and high price. Although there are provisions for 12VDC operation, the cabinet shape and lack of mounting bracket makes mobile operation impractical. Scan rate only 8 channels/sec vs. 15/sec in Regency and Bearcat. Causes RFI: Plastic case permits scanner to

radiate signals into nearby receivers.

PRO30: 16 channel programmable portable with aircraft band. Good frequency coverage. Extra controls on top allow control of SCAN, MANUAL, and PRIORITY functions while worn on belt. Good belt clip. Low audio output. Plastic case prone to break at BNC antenna connector under severe use, vs. metal frame in Regency HX1000. High price, no discounts or sales yet. I had 6 or 7 PRO30s, having to return them several times during the 1 year warranty, although other owners have had little or no trouble. Troubles included oscillation in IF stage, no UHF band reception, case broken around base of antenna connector, etc.

PRO24: Only 4 channels in this crystal controlled portable. Covers the three basic bands, but no aircraft. Easy to obtain batteries and crystals. Characteristic Radio Shack squelch problem, fixable by changing one resistor. All-plastic case larger than Bearcat Thin Scan and clones.

Craig (division of Pioneer)

4530: Japanese 10 channel crystal controlled 3 band unit. Also available under Plectron name but in different cabinet. No aircraft band. Deluxe features like priority, trimmer capacitors for netting each channel, front panel speaker, and rugged metal cabinet make this unit a winner. Channel lockout slide switches have finite life. Replacing burned out incandescent channel lamps not fun. Grab a 4530 if you find one in good condition.

Sonar:

Sonar made several crystal controlled scanners and channelized monitor receivers which shared the same RF circuitry. Each radio was housed in the same size metal case and worked on both 120 VAC and 12 VDC. The models differed in the number of channels, the band coverage, and whether individual channels could be locked out.

Although they used a 10.7 MHz first IF, Sonar radios require parallel resonant crystals different from the common series resonant crystals used in Regency and Radio Shack scanners. Some Radio Shack crystals will work in Sonar units, but more often they oscillate a few kHz off frequency and are unsuitable unless changes are made to the oscillator circuitry. Therefore, beginners should avoid these radios. Typical Sonar squelch has long time constant causing a long noise burst at the end of each transmission.

FR-104, FR-105: 6 channel monitor receivers covering 25 - 50 MHz or 150 - 175 MHz. Manual channel selection, i.e.,

no scanning. Early models are identified by an 11 pin connector on the rear and they could be used with an optional NiCd battery pack and charger which bolted to the rear panel. Later models used Cinch Jones connectors with flat contacts. Optional tone decoder board.

FR-2512, FR-2513: 24 channel versions of the FR-104 and FR-105 monitor receivers. Manual channel selection, i.e., no scanning.

FR-2514, FR-2515: 8 channel scanners. Channel 1 priority. Recommend you avoid these models as there is no way to lockout a channel from the scan sequence.

FR-2526, FR-2526, FR-2528: 10 channel scanners covering various combinations of 3 bands. Each channel could be locked out. Channel 1 priority.

Sonar Model	#chan- nels	VHF low	VHF high	UHF scans?	lock- outs?
FR104	6	X			no
FR105	6	X			no
FR2512	24	X			no
FR2513	24	X			no
FR2514	8	X		yes	no
FR2515	8	X		yes	no
FR2526	10	X		yes	yes
FR2526	10	X	X	yes	yes
FR2528	10	X	X	yes	yes

Table 1. Summary of Sonar base/mobile monitor and scanner receivers

Tennelec

Manufactured the first synthesized scanners. Company went out of business several years ago. Schematics and parts difficult to obtain. Radios reputed to be poor performers. Got my MS-2 and MCP-1 basket cases for free and sometimes regret taking them. Not worth fixing unless you have access to DTL/RTL chips and circuit diagrams.

: Two comments. First, the original message is not mine. My header was
: put on top through a crappy editing job. Second, to the lameoid who did
: not read this thread back one more message, this was a trial of a rumored
: keyboard mod taken from a service manual.

I have seen the theory of this mod in a post by Bill Cheek. It is more than just a keyboard mod, it requires soldering in two additional memory chips.. AK93C67F's (exact replacement) can be had from Tandy for about $35 a peice.. Or you can use a diff chip from Digikey (not positive on number) for $3-4.. a little cross wiring is involved.. These are surface mount chips, so its not going to be a easy mod... I'm just not sure how the wiring is going to be done.. for the chip select..

BTW, that 400 channel excerpt was printed in 2 places in the service manual.

\
Then *don't*! It's that simple!

If you feel that the information is redundant ("... no valid reason"), then
you won't be missing anything by reading only one of the two groups. Let
"natural selection" take it's course, it works just fine without clogging up
the network with useless posts and mailbombs. If only one scanner group is
needed, then only one scanner group will survive. If you feel that you *must*
read both groups, or the world will come to a crashing end, then I suggest
you re-evaluate your priorities. That is MNSHO.

Robert

I too have an old BC210 that I won't part with. Last year I bought a scanner converter, the GRE Super Converter II. It converts the entire 800-912Mhz range to the 400-512 Mhz of the BC210. It works great, and the converters are still available for $79 from Grove Enterprises. It's part number is CVR2 for handheld scanners and CVR3 ($84.95) for base scanners. Grove's number is 1-800-438-8155. Good luck.

3841. Shielded weather radio

Newsgroup: rec.radio.scanner
Date: 1994-10-14 15:41:08 UTC
From: ccopreb@phantom.oit.gatech.edu
Message-ID: <37m8qk$1im@phantom.oit.gatech.edu>
Source record: 267167

I'm looking for a weather radio suitable for use in a large computer data center. The Radio Shack weathercube we have gets clobbered by all the RF noise since it has absolutely no shielding. A scanner receives okay, but it doesn't react to the "weather-alert" tones that NOAA puts out. A shielded weathercube with an antenna jack is roughly what I'm looking for. Anyone here know where I can find one? Thanks.

That about wraps things up for this month. If anyone knows where the off switch for the sun is these days, would they please use it. Between solar conditions and the usual thunderstorm garbage, I'm being reduced to consider (gasp) TV. Maybe next month will be better (P-L-E-A-S-E !!!!). Stay cool. CUN 30.

\\\\\\\\\\\\\\\\\\\\\\\\ UTILITY NOTES ////////////////////////////////
News and Information from the World of Utilities
Richard "RD" Baker, Editor
1352 Cavalcade Dr.
Austintown, Ohio 44515-3844
Internet: ae411@yfn.ysu.edu

The most often asked question is how can a new person "break into" the utility listening hobby and understand anything at all? Well first, one has to understand that under the umbrella of "utilities" lay many different and unique sub-groups. You have your SSB or single side-band folks, who enjoy listening to several sub-groups within that area. We have maritime, international aero, government and military stations making up the lions share of listening. Now we divide say...military...into several more sub-groups such as your "serious" Air Force, or Navy listeners for example. Then some just like to tune around and see what they catch.
We have the multi-mode folks who, through the use of various decoders, search the bands for the sounds of various transmission modes, which are cropping up in a very wide variety of modes. We can again sub-divide these folks into specialty areas. For example Russian maritime RTTY or FAX reception.
Then we have the Numbers Stations folks, who enjoy the chase of finding and logging those strange numbers counters that turn up. Spies? Or Spy vs Spy? Non-directional beacon chasing also remains popular.
There are more, and not to offend anyone, the point is we have a lot of angles to look at the "ute's". So to assist the new comer in "listening to the ute's" and perhaps provide information other "veterans" didn't have before, from time to time I will present one aspect of utility listening with complete background and information as a "Monitoring the ____" series. This month the series will start with Monitoring the U.S. Coast Guard. I know there are many Speedx members who are very proficient in one aspect of the ute's or another. I'd invite these folks to interest others into their part of the hobby by writing a small article. Speedx editors start with a legal sized page. One to three pages would be ideal. Perhaps by taking the cloak off some of these stations, methods and modes more people will enjoy "listening to the ute's"!

Monitoring the U.S. Coast Guard

Members
The U.S. Coast Guard is the smallest overall in number of the five Armed Services of the United States (Army, Navy, Marine Corps, Air Force, CG). The Coast Guard becomes a part of the Navy during times of war. As of August 1991, they had 36,906 active personal made up of: Officer Corps 5,522, Warrant Officers 1,501, Cadets 921, Enlisted 29,883, and Selected Reserve 12,135. The U.S. Coast Guard traces its start back to the Revenue Marine formed in 1790. Through a variety of mergers and name changes (including the U.S. Lighthouse Service) the service became known as the U.S. Coast Guard in 1915.

Organization
Simply put, the command structure is made up of "Districts" located in the COMPACAREA or Pacific Command Area and COMLANTAREA or Atlantic Command Area. These Districts are made up of the next level in command, the "Group", as in Group Cape May or Southwest Harbor Group you may have seen logged. These Groups are made up of "Stations" (formerly Lifeboat Stations) of which there are some 150 along the shores of the U.S.
So the Stations make up the Group and the Group answers to the District who answer to the Area Command.

Boats and Cutters
Boats include approximately 2000 (number fluctuates). All craft under 65 feet in length are in this classification. Craft include Motor Lifeboat; Motor Surf Boat; Utility Boat; Surf Rescue Boat; Port Security Boat; Ports and Waterways Boat; Aids to Navigation Boat; and a variety of smaller, non-standard boats. Sizes range from 63 feet in length down to 16 feet. A "Cutter" is basically any Coast Guard vessel 65 feet in length or more, having adequate accommodations for crew to live on board. All larger cutters over 180 feet in length are under Area Commands. Cutters under 180 feet are under District Commands. The largest except for the ocean going icebreakers, are the High Endurance Cutter (hull designation WHEC). There are 12 WHEC cutters, all are 378-Class or Hamilton-class cutters. The names of the cutters honor individuals.
The next class down are Medium Endurance Cutters, or WMEC's. These are presently made up of several classes. The newest, the Bear or 270-class, are numbers WMEC-901 thru 913.
Icebreakers (hull designation WAGB): 399 or Polar-class: Length: 399 feet, Crew: 138, Maximum Speed: 18 knots, Maximum Range: 28,000 miles. These are the USCGC Polar Sea and USCGC Polar Star which serve in the Arctic and Antarctic. These are two of the largest ocean-going icebreakers in the world. The 290-class is the USCGC Mackinaw, which serves exclusively on the Great Lakes.
Icebreaking Tugs (WTGB): These are made up of the 140 Bay-class: Biscayne Bay, Bristol Bay, Katmai Bay, Mobile Bay, Morro Bay, Neah Bay, Penobscot Bay, Sturgeon Bay, and Thunder Bay.
Surface Effect Ship, "Seabird" Class (Hull designation WSES) were all decommissioned in February of this year. The three cutters; Sea Hawk, Shear-water, and Petrel, were all deployed in the Florida Keys.
Patrol Boat cutters are made up of several classes, the newest being the Island-class (Hull designation WPB-1301 to 1377).
Patrol Craft, Large are made up of the Point-class (also WPB's) which will soon start to decommission. All of this class names start with the word "Point", as in the USCGC Point Arena.
Buoy Tenders, Seagoing (WLB) are made up of several classes.
Training Cutter (WIX): USCGC Eagle is 295 feet long with a maximum speed of 11/16 knots under full sail. Training complement is 12 Officers, 38 crew, and 150 cadets (average). Eagle is a three masted sailing Barque with some 21,350 square feet of sail. Homeport is at the Coast Guard Academy, New London, Ct. It is the only active commissioned sailing vessel in U.S. maritime services and one of five such Training Barques in world. "Sister-ships" include the MIRLEA in Romania, SAGRES II in Portugal, the FGS GORCH FOCK (A-60) in Germany, and the TOVARICH in Russia.
WFCI's are the "Cigarette" boat like Fast Coastal Interceptors, based in the Fl. Keys. All are used in the drug interdiction roll, and all use tactical call signs. These cutters are believed to be to be assigned to JTF4 (Joint Task Force 4), a multi-agency drug interdiction task force.
Here is the complete breakdown of the classifications: WHEC - Heavy Endurance Cutter; WMEC - Medium Endurance Cutter; WAGB - Icebreakers; WAGO - Oceanographic Cutter; WPB - Patrol Boat Cutters; WFCI - Fast Coastal Intercepter; WIX - Training Cutter; WLB - Offshore Buoy Tender; WLI - Inshore Buoy Tender; WLIC - Inland Construction Tender; WLM - Coastal Buoy Tender;

WLR - River Buoy Tender; WSES - Surface Effects Ship; WTGB, WYTM, and WYTL - Tugs.

U.S. Coast Guard Aircraft
The HH-60J Jayhawk is the newest addition to the aviation fleet. The United States Coast Guard plans to add over 30 medium range recovery HH-60J helicopters to its fleet to replace the HH-3F Sikorsky Pelican. The H-60 is similar lo the HH-3F in many ways, and the assigned mission will be the same. However, the H-60 will have numerous upgrades including a state of the art electronics package. The H-60 is lighter, faster and the engines have more power. The H-60 will not be able to perform water landings, which the H-3 is capable of. Coast Guard Air Station Elizabeth City was the first operational unit with the Jayhawk. HH-60J Air Stations: Alabama: ATC Mobile; Alaska: CGAS Kodiak & CGAS Sitka; California; CGAS San Francisco; Florida: CGAS Clear-water, Mass.; CGAS Cape Cod; North Carolina: CGAS Elizabeth City; Michigan: CGAS Traverse City.
Long a mainstay, the Sikorsky HH-3F "Pelican" is close to, if not completely phased out of service. In 1969, Sikorsky delivered the first HH-3F to Air Station New Orleans. The basic design was put in service in 1959 with a civilian designation of S-61. A few modifications were made to this design to tailor the aircraft to the specific needs of the Coast Guard. It is from this design that the U.S. Coast Guard ordered forty airframes.
Another well used helicopter is the Aerospatiale HH-65A "Dolphin".
The United Slates Coast Guard has 96 short range HH-65A helicopters in its fleet. The twin-engine Dolphins operate up to 150 miles off shore and will fly comfortably at 150 knots for three hours. Though normally stationed ashore, the Dolphins can be carried on board medium and high endurance Coast Guard Cutters.
The primary fixed wing asset used is the HU-25A "Guardian". Forty-one HU-25A, medium range surveillance fan jets replaced the HU-16E Albatross and the C-131A Samaritan prop driven aircraft, in the Coast Guard aviation fleet. The Guardian's modern technology and design enhances it's performance as the services first multi-mission jet.

Where to Listen
Ok, now you need to know where to listen. 90% of your comms are on the following freqs:
2182 International Distress.
2670 Coast Guard cutters, SAR's and non-CG ships.
3123 Air to Ground with CommSta's
3253 1st District/Group Woods Hole.
4426/4134 4 Megs SCN or Systems Cooridination Net (Shore/Cutter).
5320 Group Common.
5692 AirSta's, Air-Ground
5696 Air to Ground with CommSta's
6501/6200 6 Megs SCN (Shore/Cutter).
6516 Cutters, aircraft, CommSta's/Groups. 50/50 secure.
8764/8240 8 Megs SCN (Shore/Cutter).
8984 Air to Ground with CommSta's
11201 Air to Ground with CommSta's

13089/12242 13 Megs SCN (Shore/Cutter).

Notice that the SCN frequency pairs are regular maritime duplex channels. These are also "public" frequencies where non-Coast Guard ships can contact the USCG also. All of these frequencies are Upper Side Band (USB). Mostly what you will hear on the majority of these frequencies are the "CommSta's" or Communications Stations. There are "senior" stations on each coast. On the east coast we have CAMSLANT Chesapeake (CAMSLANT = Communications Master Station Atlantic), c/o NAVSECGRUACT Northwest, Chesapeake, VA 23322-2598 with the call sign NMN. On the west coast its CAMSPAC San Francisco (CAMSPAC = Communications Area Master Station Pacific), 1700 Sir Francis Drake Blvd, P.O. Box 560, Pt. Reyes, CA 94956-0560, call sign NMC. Other CommSta's include: Communications Station Boston, P.O. Box 608 Marshfield, MA 02050-0005, CALL: NMF; Communications Station New Orleans, P.O. Box 520, Belle Chasse, LA 70037-0520, CALL: NMG; Communications Station Honolulu, Wahiawa, HI 96786-3050, CALL: NMO; Communications Station Kodiak Box 17, Kodiak, AK 99619-5000, CALL: NOJ. Miami (NMA) was recently closed, and Guam (NRV) has ceased scheduled broadcasts. Plans are under way to eventually run all comms from CAMSLANT and CAMSPAC via remote antenna sites.

Terms
The table below contains some of the more common USCG terms used on the air.

AIRSTA Air Station
AMVER Automated Mutual Assistance Vessel Rescue System
CAMSLANT Communications Master Station Atlantic (Portsmo
CAMSPAC USCG Communications Area Master Station Pacific
CASREP Casualty Report
CHARLIE Copy, as in Affimitive, also "Charlie, Charlie"
COAST GUARD ZERO ONE Aircraft with Commandant of USCG on Board
COMMSTA Communications Station (USN, USCG) as in Comm-S
EIGHT MEGS Refers to SCN frequency pair 8764/8240, OR 8984
ELT Emergency Locating Transmitter
ELT PATROL Enforcement of Trades and Treaties Patrol
EPIRB Emergency Position Indicating Radio Beacon
FOUR MEGS SCN Refers to SCN frequency pair 4426/4134
FOXTROT MIKE "FM" Frequency (Most often in VHF Marine Band)
FRTT Fleet Radio Teletype
HFDL High Frequency Data Link
HOIST As in doing a hoist, lifting someone from water
HOME PLATE Home Base
HOTEL FOXTROT (FOX) "HF" High Frequency/Shortwave, Sometimes Hotel
IN THE BLIND Sending Message Without Hearing Response
LANDLINE Standard Telephone
LIMA CHARLIE Loud and Clear
MARS Military Affiliated Radio System
MEDICO Medical Emergency on Board Ship
NAS Naval Air Station
PFD Personal Floatation Device

PIW Persons in Water
POB Persons On Board
RADIO GUARD Maintain a Listening Watch for Safety
RCC Rescue Coordination Center
RDF Radio Direction Finding
RTB Return to Base
SAR CASE Search & Rescue Mission
SARSAT Search & Rescue Satellite
SCN Systems Coordination Net
SEVENTEEN MEGS SCN Refers to USCG SCN frequency pair 17314/16432 Khz
SITREP Situation Report
SIX MEGS SCN Refers to USCG SCN frequency pair 6501/6200 Khz
SOB Souls on Board, Older Term for PIB
SOS Save Our Ship, Mayday
UNIFORM HOTEL Frequency band, as in: "UHF" or AM military aero
WILCO Military Term for Will Comply
WINDOW FREQUENCY Frequency of Actual RF Carrier

"That's a charlie, charlie" would mean "that's a copy" or yes, I understand. The letter "C" being the first letter in "Copy". The phonetics make it more likely the message will be received.
Another typical message may go like "CommSta Boston, this is Coast Guard Rescue 2113, we were airborne at minute 35 from home plate AirSta Cape Cod with five POB. We are enroute to an EPIRB activation at (lat/lon) and request you take our radio guard".
So, 2113 is in comms with Communications Station Boston (NMF) and is telling them they took off from Air Station Cape Cod at 35 minutes after the hour with five persons on board the 2113. They are going out to check an Emergency Position Indicating Radio Beacon that has been detected as activated and they are requesting Boston maintain a listening watch for their safety.
Boston will confirm the data, and state "standard flight op's" and assign a primary and secondary frequency for the 2113 to use. Standard Flight Operations call for the aircraft to check in each 30 minutes with their position as long as they are airborne.
Coast Guard aircraft tasked on a SAR will ID as "Rescue" and their four number aircraft ID. Those not on a SAR type case will simply ID as "Coast Guard" and the four number ID.
Aircraft ID numbers are as follows:

1430-1497 HH-3F "Pelican"
1500-1720 HC-130 "Hercules"
2101-2168 HU-25-A "Guardian"
6001-6071 HH-60J "Jayhawk"
6501-6599 HH-65A "Dolphin"

A conversation I had recently with a former "Coastie" who flew HC-130's led to one term change. That was "home plate", which I had always taken to be "home base". Not so says the former flying Coastie, merely the point of departure.

I hope this quick tour helped shed some light on these comms for you. The U.S. Coast Guard also happen to be very good QSL'ers and offer excellent public relations with SWL's and amateur radio operators. Much of this information is courtesy of the USCG.

Some of the best listening I have heard has been on the U.S. Coast Guard HF frequencies. I hope you'll give them a listen. And, I hope you like this new feature!

While on the subject, Art Blair out in San Francisco checks in with some U.S. Coast Guard HF information from a 1994 Special Notice to Mariners:

MILITARY
U.S. Navy
~ The U.S. Navy George Washington J.T.G. deployed May 20. The group, centered around the Nimitz-class Nuclear Aircraft Carrier USS George Washington (CVN-73), making her first deployment. The George Washington and the Iwo Jima-class Amphibious Assault Ship USS Guam (LPH-9) will relieve the Saratoga JTG. Upon return, the Forrestal-class USS Saratoga (CV 60) will stand-down for decommissioning in August.
~ Jamaica recently agreed to let a U.S. vessel anchor in Kingston harbor, where it will be used for processing of Haitians found at sea. Under the plan, Haitians found at sea by the U.S. Coast Guard will be brought to the USNS Comfort (T-AH-20) anchored in Kingston harbor. There, 300 personnel, some of INS, and UNHCR personnel will interview them to decide if they are eligible for asylum. The Comfort left Norfolk, VA, earlier in June for Guantanamo Bay. This may be a rare change to log the USNS Comfort by either her international call sign NCOM or her Mars Station, NNN0CCF.
~ The U.S. Navy Cyclone-class Coastal Patrol Boat USS Scirocco (PC-6)

was commissioned recently. Scirocco was the first Navy ship commissioned at the Washington Navy Yard in almost 120 years.

MARITIME

~ Tom Roach (CA) reports that recently Vladivostok Radio, UKA, on 8575 kHz, apparently changed their call sign to UFZ. Tom further reports "it is still in Vladivostok and works a small (probably single company) number of Russian fishing vessels".
Also, from the SWL Sig on Youngstown Freenet, I have news of another probable change for Arkhangelsk Radio. Derek Cooper in the UK reports hearing the call UCE for the last several months now on frequencies where he used to hear UXN. Can anyone confirm this is a callsign change for Arkhangelsk Radio?
Lastly, for the past seven to eight weeks, I have seen Russian and one Lithuanian ship sending RY markers in RTTY to "UIW". As I use a M-1000 decoder I can't determine for a fact if this is UIW or UIV as the M-1000 has no cyrillic capability. In non-cyrillic decoders, "W's" can also be "V's". Either way, its a new one. Following these RY markers, the telegrams or messages have been addressed to Murmansk, Kaliningrad and Riga Radio's, so no help there on the ship end yet.
~ For those of you who like odd things, Dutch Customs Service officers inspecting the Russian factory trawler BMRT Labrador (UHUS) after it docked today in Ijmuiden, the Netherlands, found a body in the ship's freezers. The master of the ship said the body was that of a sailor who committed suicide at sea April 27. The captain ordered the body placed in deep-freeze until the ship returned to Russia. However, the captain didn't inform the officers of the body until it was found. A Dutch public prosecutor has confiscated the body and ordered an autopsy. The Labrador is heard quite often here in NE Ohio and I've logged her a number of times. Now...how many times have we all forgotten little things when we're busy....? Geez...DE RD

==========
Note: This is the Oct. 'Electronic Edition' and is from the July 1994 SPEEDX member bulletin "Shortwave Radio Today", ISSN 0882-8091. SPEEDX utility coverage now consists of three columns:

UTILITIES: Edited by Mike Wolfson. Logging's, frequencies, and schedule information. Contributions in these area's can be sent to Mike.

UTILITY NOTES: Edited by Richard "RD" Baker. News and information about the world of utilities, and utility stations. Contributions in these area's can be sent to myself.

UTILITY VERIFICATIONS: Edited by Tim Braun. "UTE" only QSL's and Verifications. QSL info. I hope to add Tim's column to the electronic edition soon.

SPEEDX members had this information over 2 months ago! If you would like to recieve this information as quickly as our members do, SPEEDX publishes a monthly DX bulletin of around 43 pages, Shortwave Radio Today (ISSN 0882-8091). Some of the other column's include:

THE DXperience: Focusing on notes,news,and views of what's happening in the exciting world of Shortwave radio. Edited by Dan Brame

TRASH & TREASURE: Information on catalogs, freebies, promotions, and SWL related items. Edited by Donald F. Weber

WHAT'S ON: A program listing, and some freqs for SW Radio edited by Daniel Sampson. (73540.3025@compuserve.com)

SHORTWAVE TO GO!: News and information on shortwave broadcast stations. Edited by Richard E. Hankison
WESTERN HEMISPHERE: SWBC logging's column edited by Don Thornton

EUROPE: SWBC logging's column edited by Tim J. Johnson

THE COMMONWEALTH: SWBC logging's column edited by Bruce Robinson

AFRICA: SWBC logging's column edited by Paul Wakefield

ASIA/OCEANIA: SWBC logging's column edited by William Westenhaver

QSL REPORT: a QSL reporting column edited by Michael Fanderys

SPEEDX AWARDS: A wide variety of awards are available for members DX'ing accomplishments, Harold Woering, Awards Chairman

....and more!

If you would like to learn more about the SPEEDX radio club, (the Society to Preserve the Engrossing Enjoyment of DX'ing), a Non-Profit ALL Volunteer hobby organization founded in 1971, please write to Bob Thunberg Business Manager, SPEEDX, P.O. Box 196, DuBois, Pennsylvania, U.S.A., 15801-0196. Club dues are as follows:

USA and Mexico $23.00
Canada (AO Airmail) 25.00
Central/South America, Caribbean (airmail) 29.00
Europe (AO Airmail) 33.00
Africa/CIS/Asia/Oceania (AO Airmail) 37.00
Outside North America (Surface Mail) 23.00

All prices are in US funds. Tell Bob you heard about us from the Electronic Edition!

From: dans@rehab1.UUCP
Message-ID: <1099@rehab1.UUCP>
Source record: 267197

The local county police dispatch frequency causes my RS 2006 to lock
on our local fire district F3 frequency. Of course I can reach around
the back and flip the switch to 10db - but as you know this affects the
signals I hear.

So what im looking for is plans to make a trap (maybe out of coax?).
The best result would be to reduce the signal of one frequency just
enough to remove the problem (then I could still monitor when needed).
But if the only solution is to remove this frequency thats fine. I do
happen to have a few other scanners around ;-)

If you're doing your own code, try sending a stop_scan, then start_scan
command.
I use Ben Saladino's RadioManager, and the effect shows up there
as well. I can't think of a way he could avoid the problem because he uses
the tape relay. If I make the program skip off the present channel, the
program stops again because the tape relay is still activated.

I don't have my CI-V, book handy. Is there a command to turn off the relay?

> From: gary@phoenixs.co.uk (Gary Smith)

> Could anyone who owns one of these scanners please let me know if it
> is any good or if someone knows of a simlar but better model.

Let me put it this way--I bought a PRO-44 in March and I'm already shopping for a new one. And that's not just because I've outgrown 50 channels. :)

The case of mine is cracked and beaten, the battery door doesn't stay shut without some tape, the pin on the CHG socket is broken off [meaning I can't charge batteries in it any more], and most annoyingly.. it seems like a board is cracked or something. The antenna, when wiggled, will break squelch on the radio and prevent it from working. Oddly enough this happens most often when it's clipped onto my belt [and moving around as I do].

Now, I *do* acknowledge that part of this is my fault for being a firefighter and taking it anywhere with me [no, it's not been in a situation where it could be burnt.. YET :)] .. but I wonder if maybe there's something better.

I was originally looking at a PRO-43, but would it exhibit the same problems [esp. with the board/antenna]? Does anyone know? If so, I might have to pass on it.. I'd like a scanner with the following, if anyone can offer me any suggestions..

100 or 200 ch.
Able to pick up the following: CBs, air, VHF-hi, VHF-lo, UHF, 800MHz (no, not cell, I mean like trunked systems]
Triple conversion
GOOD CONSTRUCTION

Anyone got any ideas?

Remember that *everything* going into and out of the can has to be either shielded (the antenna) or bypassed and filtered out the kazoo (power, spkr) or you'll have those leads reradiating crud inside the shielded enclosure.

> protection" added to the bill, rather it was in the bill from
> the very beginning.

Not the *very* beginning, but you're right, it looks like EFF didn't put it in. I just checked the EFF's archives on the bill. The cordless phone stuff wasn't in the '92 draft bill, but it showed up in the February '94 draft. I don't think the EFF started working on the bill until later in the spring or summer. (See ftp://ftp.eff.org/pub/EFF/Policy/Digital_Telephony/Old for more.) I'm still disappointed with the EFF's analysis that referred to the ban on cordless phone scanning as a "significant new privacy protection," but I'm glad EFF isn't responsible for this provision of the bill.

Joe

> foot).

No offense, but whoever told you to use RG-8/58 doesn't
know much about scanner frequencies and coax cable. That
person is assuming you need 50-52 ohm cable for the
receiver, at the expense of very high signal loss in the
cable. Remember, RG-8/58 is designed for low freqs, like
the 0.1-30 MHz range...not the 30-1000 MHz range that most
scanners cover.

A good cable to use would be RG-6, sometimes referred to
as satellite cable. It's impedance is 75 ohms instead
of 50-52, but for receivers, it's not that critical.
Any loss in the impedance mis-match is easily compensated
by the MUCH lower line loss of RG-6 over RG-8/58. This
is especially true at higher freqs like 100-1000 MHz that
many scanners receive.

A better choice would be RG-213, and one of the best
cables you can buy would be Belden 9913. These two
cables cost a little more per foot, but they are worth
it.

> 2) is on top of house about 50 feet. Is over 100 feet to far to run cable
> or
> is shorter the better?

The shortest cable run and the highest antenna location
is the best combination, even though it's a contradiction
in terms...<Grin>

Mount the antenna as high as possible, but keep the run
of cable to a minimum...don't waste signal gain by running
the cable down a pole, under the ground, across the yard,
inside the house and so forth. Run the cable as direct
to the receiver as possible.

Height can often make more of a difference in signal gain
than anything else, and increasing the height of the
antenna by 10 feet translates into almost 3dB of signal
gain, or twice as much signal, under many conditions.

3863. Short PRO-43 Battery life?

Newsgroup: rec.radio.scanner
Date: 1994-10-14 23:22:23 UTC
From: ssyck@alpha2.csd.uwm.edu
Message-ID: <37n3rf$eg4@uwm.edu>
Source record: 267078

Just wondering..

Is the PRO-43 known for having a rather short battery life? I bought mine a couple of months ago with new Nicads and they don't seem to last very long even when fully charged. About 4 hours is all I can get. This is scanning 3 banks and with the 'pri' channel turned on.

Any suggestions to get longer life out of the batteries? I was thinking of getting some Renewal alkalines. Would they last longer? Or did get some bad nicads?

Thanks much
-Steve

3864. Re: ELIMINATE ALT.RADIO.SCANNER?

Newsgroup: rec.radio.scanner
Date: 1994-10-15 00:53:01 UTC
From: shawn4sk1@aol.com
Message-ID: <37n95d$c17@newsbf01.news.aol.com>
Source record: 267091

Many of us have asked why there are two scanner groups. At one time I thought about creating a game plan to do away with the alt. group as there is always half as many posts on it and I felt like I was playing the cat-n-mouse game trying to find things I was interested in between the two groups. I also quickly got tired of reading messages that had been posted to both groups for whatever reason the person decided they needed to double post ALL of their messages (you know who you are!!!)...

I finally made it clear in my last post to alt.radio.scanner that if anyone felt they had anything worthwhile to post, they should post it to rec.radio.scanner and that I would no longer support alt.radio.scanner by posting anything to it. Every once in awhile I read the alt. group just to see what they're up to- definately not a thing. The alt. group has to exist, from what I understand, because some people's Internet providers only offer alt. or rec. groups, not both... This is where I reasoned with myself and figured "Why dog people for using the alt. group- for some, it's all they have...".

Once again, I gladly post: If you have anything you want to say or ask, ask it on rec.radio.scanner. Everybody's great and it'll surely be worth your while. As far as alt.radio.scanner, well... just don't post to it or read it if you don't want to. I don't. I'm not missing anything. I just accept the reason why there's an alt. group but don't waste my time on it...

And Jim, as for your statement where you said " I am tired of reading two newsgroups for no valid reason!!", people who like to flame people on the Internet will sure have a fun time lighting the torch to you... I can see it coming- thought I'd warn you.

Happy rec.radio.Scanning!

" : Subject: Re: your mail
" : To: Glen Roberts <glr@rci.ripco.com>

" : Please remove us from your distribution list. The Palo Alto Weekly is a
" : strictly local newspaper covering Palo Alto, Calif., and surrounding towns
" : only. Thank you.

" I'm confused at your reaction. Listening to cordless phones is already
" illegal in CA, so their response is not unreasonable.

Unreasonable? Perhaps not.
Your response is pretty typical. Quite a few people equate security with legality. Whether or not the practice of monitoring cordless calls is illegal or not it would be nice if the general news media would carry an article of the inherent problems of casual cordless use and some of the problems encountered.

I used to live in Palo Alto and had a run in with the Palo Alto Police Dept. before the ECPA became law. I had been having a conversation about my antennas and what not when my neighbor took a call on his cordless phone. I advised him that he really should be careful about what he said over the cordless phone.
[snip to the heart of the matter]

He called the PAPD and wanted me arrested for wiretapping. The officers who responded were on unfamiliar ground and placed me under arrest after I gave them a not-so-brief tour of my station and it's capabilities. I suggested that they might want to contact the FCC field station in Livermore and get some input from a field engineer before they made a SERIOUS mistake.

The officers left quite a while later with a better understanding of modern technology, cordless phones, baby monitors, and complete list of frequencies that they might find interesting in the future as they cruised around with their scanner equipped cars...

We even had discussions about the city purchasing baby monitors and offering them under some pretense as prizes to individuals who were suspected of dealing drugs from their homes. The police would then monitor the constantly open microphones for information. We were such creative little devils in those days...

As I say, this was 10 years ago. Today, the cordless phone is looked upon by most of the population (readers of these groups excepted) as a perfectly harmless and wonderfully useful tool for a busy society. Many people frequently forget that they should NEVER use the cordless phone to order items and pay with a credit card or to talk about sensitive issues or travel plans.

The response of the PA Weekly may not be unreasonable, but it sure was shortsighted. After all, they're not know for Pulitzer Prize articles... The topic of cordless phones and privacy is an important one for most of us. We've had the benefit of discussion. Most of the people in this country have not.

Message-ID: <kjnCxozuD.BLD@netcom.com>
Source record: 267108

Jim Wayda says:
" Why not just have one newsgroup. Let's all band together and eliminate
" alt.radio.scanner. This can be done as follows:

This comes up all the time! Keep in mind that not all servers carry the
rec. newsgroups. Some carry alt. but not rec. (don't ask me why.)

" Post the following message to alt.radio.scanner and repeat the message many
" times on a daily basis:

Stupid, childish idea! A waste of bandwidth (as is this response...)

" "If you are posting to alt.radio.scanner, please post to rec.radio.scanner
" so that we can eliminate alt.radio.scanner and have one scanner newsgroup.
^^^ Who the heck is this WE?
So, who made you net police???

" Thankyou for your cooperation."

" I would appreciate replies and help from anyone and everyone. I am tired of
" reading two newsgroups for no valid reason!!

Then don't!
If your time is so valuable then it should be better spent on more
productive issues than trashing a newsgroup that you have no interest
in reading.

Don't mean to be too harsh, Jim. The question is an obvious one. There
are duplicate newsgroups all over the place. Take a cruise down the list
of possible groups. You will find a lot that have 0 messages. Just
failing to post to a group will, unfortunately, NOT make it go away.

regards;

Hows does LIDAR calculate speed? I thought Laser Doppler Radar uses DOPPLER
Doesen't the unit have to transmit a burst of light, pick it up on a
photodetector, and calculate the time it took? And then try again calculate the
diffrence.

Actually, they support it because they *think* it protects their privacy when in fact the law does nothing! If our representatives <cough> really wanted to protect communications, they'd require the phone companies to scramble the cordless and cellphone transmissions.

As with the "crime bill", this is precisely the kind of symbolic lawmaking we've been getting for far too long now - laws that are simple to pass which avoid real issues and give a naive electorate the feeling that "something is being done".

Message-ID: <37odqh$osl@merlion.singnet.com.sg>
Source record: 267163

I have some questions for cordless "experts":

1: What is the best antenna to use for 46Mz?

2: I notice the IC-R1 when fitted with it's standard duckie works _much_ better when (strangely) the end of the Sony AN-61 compact antenna (comes with the Sony SW radio) is in close proximity to any part of the duckie. Is there a device to reproduce this effect.

2: What is the principle of the Sony AN-61 anyway? How can I make one myself?

3: How is it that reception is much improved for hand-helds when held? Can this improvement of reception be mimicked by any device?

Very poor choice, unless you plan to recharge every few days. The 200XLT
always drains the batteries, to keep the memories alive. NiMH cells
SELF-discharge about 3 times faster than nicads. Put these two conditions
together and you have a frustrating combination.

There are lots of scanner that scan down to 25 mhz (my RS PRO-2006 does),
with some going down to 500 khz and below. But in general, scanners
aren't really a substitute for shortwave radios, so scanning down there
may not be achieving much, especially if you don't have connected a
proper antenna for such frequencies.
But I do have all 40 CB frequencies programmed in my scanner. The
reception is acceptable, but I'll never get the SSB CB frequencies on
my scanner. Anyway, there are scanners out there that do CB, but CB
radios themselves are very cheap. You might as well buy one, in case
you do get the urge to transmit too.

And I have been doing a lot trying to educate people of what is really happening in WDC. Those that care about their rights will join in while the net.nannies use kill files and encourage others to do so too.

I suppose they have initiated the net equivalent of the death penalty, something they probably have a problem with in the real world. This further underscores the hypocrisy found within the confines of the radio groups.

They want to play like the whole world revolves around the latest deal on the superradio or whethere or not the latest copy of Passport has arrived, and in so doing have found themselves to be the 20th century equivalent of Nero: fiddling while Rome is burning.

The time to act is NOW, the time to VOTE is November 8. I recommend doing away with the Democratic majority the House has had since 1954. This is the first place to start the sweeping changes we all feel is needed in our hearts. THE DEMOCRATIC PARTY HAS HELD CONTROL OF THE HOUSE UNINTERRUPTED SINCE 1954. IT IS TIME THIS CHANGES!

THE CONGRESS IN COLLUSION WITH BILL CLINTON HAS INCREASED THE RATE OF THE ATTACKS ON YOUR PERSONAL LIBERTIES>. IT IS TIME TO STOP THIS BEFORE WE HAVE TO RESORT TO DRASTIC MEASURES. USE THE SOAP AND BALLOT BOXES SO WE DO NOT HAVE TO USE THE CARTRIDGE BOX!

So your action, reapeat after me, is to not vote for anyone that allowed
this bill to pass by:
1) voting for it
2) not voting against it.
It is high time to get rid of the rights grabbing democratically controlled
congress. The House has been continuously controlled by the democrats
since 1954. Think of how many rights we have lost to those schmucks
since then!

I am not sure what you are going to use to listen to them on. Remember that
the congress is taking away the FCC's ability to type certify radios
that can pick up cellular, how long before they do the same for cordless
capable receivers?

How long before it extends to receivers which can listen to the police? Do you
now understand?

3887. Query: Tracking frequency for Whooping Cranes?

Newsgroup: rec.radio.scanner
Date: 1994-10-15 15:39:06 UTC
From: garyposs@bga.com
Message-ID: <37ot2q$9rf@giga.bga.com>
Source record: 267054

I am looking for the frequency used on tracking transmitters that are attached to Whooping Cranes as they migrate back and forth between their habitats.

Their was a PBS documentary somtime back where state/federal wildlife agencies tracked Whoopers across the United States. Tracking equipment was shown including vhf yagis and what appeared to be a DAVCO receiver.

Do you have any information related to this tracking activity, including migration schedules?

Thank you.....Gary

sc> Tell me about NiMH - are they the same size as regular AA's and can I
sc> charge them in my regular NiCad charger? George - segenreich@delphi.com

AA is AA size, and will replace AA batteries.

You can charge NiMH in a NiCd charger, but it is not the best way. You really need one which will charge at the proper rate for NiMH v. the NiCd rate.

You also need to have trickle charge on NiMH due to the higher self discharge rate of NiMH v. NiCd.

Using a NiCd charger on NiMH will DEGRADE performance over time.

Hi Paul!

On 08 Oct 94, Paul Nash illuminates speedily to All:

PN> Oi.. A friend of mine bought a Radio Shack CB, and found that it was
PN> defective a day after, so he took wrote down the SN and took it back..
PN> About a week later, he convinced me to purchase the same model.. As it
PN> turned out, 3 hours after I bought my scanner, it crapped out.. I called
PN> him up, and he read off the SN.. It turns out Radio Shack just threw the
PN> scanner back in the box, and put it on the shelf.. Grrrr, another wasted
PN> trip was made out to RS... After confronting the manager, they said that
PN> they were really sorry, and that the cb was supposed to be shipped back
PN> for repairs.... Ahh well.. Everything I ever bought from Radio Shack
PN> crapped out within 2 weeks.... Paul

Sorry to quote your whole message, Paul, but I was confused by it. You say at one point your friend bought a CB. Later, you buy a scanner, but it turns out to be the CB your friend bought. The radio shack guy threw a scanner back into the box (he also was confused, evidently). But in the end they were sure it was the CB that was to be sent out for repairs. When you get this story straight and/or quit smoking those funny cigarettes, let us know what really happened. :) Maybe the reason your equipment "craps out within 2 weeks" is that you forget what it was really supposed to do. :)

Best wishes from Richard

Since you're new, a suggestion I would make is to give your posts a
descriptive title.
Just typing "HELLO!" won't catch many usenet browsers attention.
Something like "Radio Shack PRO-2035" would, since it is a new product.
As far as the 2035, I've seen a couple mixed reviews posted here about
it. It seems like a fairly decent scanner, but probably isn't modifiable
to get the whole 800 mhz band (at least no one has said they've discovered
a way yet) in order to comply with ECPA.
It's the successor to the 2006, which I do own, and was very easy to
modify. Probably the main two advantages to the 2035 would be the faster
scanning rate, and larger channel capacity (1000 vs 400).
Hope you enjoy your new scanner.

3897. AOR Scanners

Newsgroup: rec.radio.scanner
Date: 1994-10-15 22:26:20 UTC
From: bcorson@iat.holonet.net
Message-ID: <CxqJnx.Gq1@iat.holonet.net>
Source record: 267073

I have a question on AOR scanners, although I have no plans on buying one.
I see the AR3000A ($1099) and the AR2800 ($459) listed in Tucker Electronics (800-527-4642) Summer catalog. I don't know if they're still available, but are AOR scanners any good?
The AR3000A is a desktop model, and has coverage from .1 to 2036 mhz (continuous). The thing just weighs 1.2 kg. You would think for $1099 they would make it out of something more substantial, like a shielded-metal case, not light-weight plastic. The AR2800 covers .5 to 1300 mhz. Are these scanners deaf on the shortwave bands?
I also see a handheld AR1000XLT for $419. Any experiences with this?
Thanks

: And I have been doing a lot trying to educate people of what is really
: happening in WDC. Those that care about their rights will join in while
: the net.nannies use kill files and encourage others to do so too.

I know Richard realizes that I'm not advocating others use (or not use) kill files. The purpose of my comment was to indicate why I felt it necessary to speak about off-topic postings even though I'm fully capable of skipping them.

My concern is that when some posters raise issues such as "Throw the rascals out!" not everyone agrees and a heated discussion often takes place over . . . throwing the rascals out!

However, I cannot recall a single posting this year in which someone said that we should have our rights to monitor restricted.

My conclusion, then, is that the group could be highly effective is safeguarding our right to monitor it we focused on our rights to monitor.

If there had been a simple notice that the recent (crime? telecommunications?) bill had contained a blanket prohibition against monitoring frequencies used by cordless phones, perhaps we could have organized and done something about it.

Instead, people are discussing--AS IS THEIR RIGHT--liberalism, conservatism, throwing out the Congress and the right to bear arms.

Conspiracy theorists, are these distractions placed here by those who would take away our rights to monitor as a way of keeping is disorganized and off balance? No? I can't think of a more effective way to keep us disorganized and off balance.

A while back there was a thread about air-show frequencies. Today, there was a small air-show here in Key West. We had some F-14's and F-16's, a C-130, some bi-planes, and some jumpers. The show was being coorinated on 305.200 Mhz. The voice at Air Show control sounded like the same guy in the Key West International Tower.

The point being, the show was being controlled by a Civilian facility, with a mixture of Military and Civilian events and the freq was in the Mil Band.

What a load. The bill that Mr. Crisp finds offensive (and no, I don't like it myself either) was sponsored by Democrats to forestall something custom-written by the FBI getting introduced by an FBI-friendly congresscritter and gaining approval. Read the EFF briefs on this bill that were posted a month or so ago.

The Republicans didn't sponsor the bill that Mr. Crisp finds offensive, not because they thought it was too intrusive, but BECAUSE THEY APPARENTLY DIDN'T SEE ANYTHING WRONG WITH AN EVEN MORE INTRUSIVE FBI-DESIGNED BILL GETTING APPROVED LATER!

Yes, this is off subject. But after biting my lip and not posting it time and time again, I couldn't hold it in any more. So sue me.

Damn, that felt good!

Timster-
I have an AOR-1500 and i dont like it. It suffers from too much
intermod (lots of pagers and FMers bleeding all over) and when i hook up
my amplified rabitt ears which is connected to a 4 way to hook up my other
scanners, it locks up A LOT on the oscillators of the other scanners, and
the overload gets REALLY bad. I am looking at getting an 8000 myself and
cashing in the 1500. When i use the rubber duck antenna the problem goes
away to a point, but it still has to be several feet from the other
scanners(ergo several feet from me) and the reception is limited without
the amp of course. And it is pretty complicated to get to program and
just make basic changes. If i had it to do over, my advice would have
been to either take a step down in freq range and channels and get the Rat
Shack 43(i have a 32 and 34 and love them to death!!!) or go the other way
and get an 8000....wanna buy my 1500 by the way?????? like new

3908. Re: Short PRO-43 Battery life?

Newsgroup: rec.radio.scanner
Date: 1994-10-16 04:21:32 UTC
From: mulligan@ACM.ORG
Message-ID: <37q9oc$29i@hopper.acm.org>
Source record: 267141

Typical NiCad life in a PRO-43 is 6 hours for 600mah batteries. A test
using standard R.S. NiCads with: Scan mode, minimum squelch, minimum volume
(i.e. receiving, but no audio out) produced a battery warning at 6h 4m and
a dead radio 9m later. Maximum audio would reduce this by 1/3.
The current draw for a sample PRO-43 was: max. audio, 150ma; normal audio,
90-105ma; squelched 85ma. In the battery saver mode the draws were 6.5ma for
1 sec and 80ma for 1/4 sec, yielding an average draw of 21ma.

: oh about 18 years ago and it's still working like new and then there's
: my eight channel scanner that's been through two car accidents and 14
: years of beating and it still keeps right on ticking and then there's my
: STA 2100 240 watt stereo receiver that's about 12 years old and gets used
: every single day! I could go on & on & on but I would just have to
: suggest
: maybe reading the owners manual once in a while and maybe your stuff
: would last.

And then, there is my stereo receiver - which has not worked right on AM ever since I bought it. It has been in for repair 4 times, and will work correctly for a week or two - then go on the fritz again. I have given up on the piece of crap, and only use it as an amp for my tape deck.

The scanners and ham transceivers are good. Much of the rest seems to be mediocre to poor.

: not in the same way. We worry about impedance matching our feed on a
: transmitter because we don't want reflected power damaging the radios. And
: because we want as much of our transmitter power to make it to the antenna.

Reflected power cannot damage the transmitter. Work it out on a Smith Chart, if you don't believe me. The power does not get back into the finals. The only power loss is resistive losses in the coax.

However, the reflected power causes the final efficiency to be lower, which means that the final amp runs hotter, which can cause it to fail.

orion1@iastate.edu (Alex Orion Leu) writes:
:
: 3. Laser was invented for the patrol because of two reasons. First, it is
: tougher to detect because it diffuses very fast and doesn't carry the
: signature that sets many K or X radar detectors off. Second, it gives a
: much stronger signal as compared to K or X. With old radar it is very tough
: to get small vehicles on radar, unless they go very fast.

This whole paragraph is silly. The primary reason for lasar time and distance measuring equipment (there is no such thing as lasar radar - at least, not yet) is that it does NOT diffuse anywhere near as rapidly as radar. That is a characteristic of coherent waves. It can easily be aimed at One target, so there is no confusion over which vehicle is being clocked.

Because the energy density of the signal striking the vehicle is higher, it returns a stronger signal.

The last bit about clocking small vehicles is also false. You can use a handheld radar to clock baseballs - which are a lot smaller and not nearly as good a target as even the smallest motor vehicle.

: 4. A new brand of Canadian radar now comes with a detector that hunts out
: jammers. It is available in the U.S. and it does detect laser radar
: jammers(I have only seen ads). There are also detectors that detect these
: detectors. Be advised that if you are caught with a jammer not only do you
: face a stiff state fine but you may be prosectuted under the federal code
: which is 5 yrs. and $10k. In Iowa it is a simple misdemeanor(30 days and/or
: $150 fine). I can promise if you are caught by an officer plan on getting a
: ticket and a possible vehicle inspection and impoundment to determine if
: there are any other devices in you vehicle(Yes, it is all legal).

This is correct. You can be charged with obstruction of justice, interfering with an officer in the performance of his duties, malicious hindering etc. They do not even have to mess with wimpy jammer laws.

: 6. Police motorcycles also have permanent mounts and the handhelds have a
: holster on the bike. Most motor officers know better than to place the unit
: between their legs because it may side out and get caught on the bike or
: destroy the radar unit and the last thing an officer needs is to get tangled
: in his radar unit.

Or get tangled in the wheels or chain, and cause the officer all sorts of grief. Thanks for reinforcing my point.

Anyway, the Yupiteru 7100 is only 20 UKP more expensive and that *is*
totally cool - still the one to beat, as far as I'm concerned. With
luck, the slide in the price of the 7100 is the first fallout of the
laughable US scanner laws, with more to follow, I hope :)

> Typical NiCad life in a PRO-43 is 6 hours for 600mah batteries. A test
>using standard R.S. NiCads with: Scan mode, minimum squelch, minimum volume
>(i.e. receiving, but no audio out) produced a battery warning at 6h 4m and
>a dead radio 9m later. Maximum audio would reduce this by 1/3.
> The current draw for a sample PRO-43 was: max. audio, 150ma; normal audio,
>90-105ma; squelched 85ma. In the battery saver mode the draws were 6.5ma for
>1 sec and 80ma for 1/4 sec, yielding an average draw of 21ma.

These figures are in close agreement with the PRO-43 I tested.
From my comparison with the Uniden/Bearcat 200xlt, posted previously:

"Current drain from batteries was measured at 88 ma. while
scanning and 90 - 140 at various settings of the volume con-
trol with the squelch open. The PRO-43 averages 36% higher
current drain than the 200XLT which means the batteries will
need recharging more frequently."

Non-rechargeable alkaline batteries work better than NiCd cells
in my PRO-43 application.

>using a scanner in a vehicle. Am I correct?

>I would appreciate any comments on this issue.

>thanks,

>+-Jim

>jim@ttech.com
Jim; the laws depend on your state. The exemption specifically mentions transcievers as being exempt. In the peoples republic of New York it is a violation of MV&T laws to have "any reciever capabile of recieving public safety band transmissions" I think the ANT covers hand held scanners. There has been a lot of discussion on whether the Ham exemption covers scanners and most feel that it dosen't.

This is al the more reason for Hams, ARRL etc to get on the stick and help get these laws removed. The airwaves belong (read are supposed to) to the people. It is up to us to tell congress and our other lawmakers which people we mean. Don't think it will get better just because you are a Ham, it will only take them a little longer to get to you.

It's so-so. 50 channels, pretty good coverage (air and federal, but no 800).
The biggest pain is that you can't set an upper and lower limit to
search between. You CAN search upward or downward from a frequency, but
it just keeps going and going......

==========
BLUE ANGELS/THUNDERBIRDS
==========
According to the 8th edition "Registry of US Govt. Freqs" by Tom Kneitel,

The Blue Angels are.....
121.9, 123.4, 134.1, 141.56, 142, 142.025/142.65, 143, 143.6, 241.4, 250.8,
251.6, 275.35, 307.7, 360.4, 384.4, 391.9, 395.9.

The Thunderbirds are.....
66.9, 114.95, 120.45, 123.4, 124.935, 140, 140.4, 141.85, 235.25, 236.55,
236.6, 250.85, 273.5, 283.5, 295.7, 322, 322.6, 382.9, 394.
Thunderbird ground crew....
413.025, 413.075, 413.1, 413.15, 413.275, 413.35, 413.4.

Most air comms should be AM while ground crews are most likely FM.
Although no ground crew was listed for the Blue Angels, check out the
140 MHz stuff for that. Also, the 142.025/142.65 is likely a repeater
output/input.

- writer unknown

Following frequencies for the Thunderbirds.

66.90
114.95
118.1
120.450 F-16 stunt coordination
123.540 air show control
124.925 air to air
126.2 tower

138.875
141.850 air coordination (verified)
148.550 maintenance
241.4

250.85 team leader command
273.5
283.5
295.7
322.3
322.6
382.9
394.0
413.025 ground support crews

THUNDERBIRD FREQS. 5-JUL-1989 12:45
Heard on Jul 1 & 2 1989 from Hanscom AFB:

T-Birds: 141.850 & 236.550

Blue Angles Thunderbirds
142.0 120.45
143.0 126.2
143.6 141.85
241.4 413.025
251.6
275.35
384.4

Otis AFB in Massachusetts on Sunday July 10, 1988.
I had a Radio Shack PRO-2004 hooked up and monitored all frequencies
that I have heard of in this notes file and DX publications. The only
active one was 141.850 MHz in the AM mode. This was used for flight
coordination between planes.

318.900 A-A 395.500 A-A
345.900 A-A 395.900 A-A

I recently saw the Thunderbirds at Wilkes Barre-Scranton (PA) air show.
Here is what I VERIFIED -
141.850 - By far the busiest freq - used before and during the show.
Before the show they ran thru the whole routine on this freq
and during the show this was the MAIN delta formation freq.
322.950 - Used on the ground before the show for pre-flight check out.
During the show was used by the two solo planes.
235.250 - Was ID as TB control but was used very infrequently.
413.100 - Very active before the show. Mainly maint and "get ready"
type chatter, ground crew, maint etc. Was used as the
T-birds were taxing out to inform them that their "chatter"
was being re-broadcast thru airshow PA system.
120.450 - Before show seemed to be keyed along with 141.850 but during
the show there was no further activity on this freq.
122.850 - Used by "Swift Magic" and couple other acts during the show.
I have seen both the Angles and the T-birds and I can tell you the
T-birds have MUCH more chatter to listen too, although both teams are
GREAT.

- writer unknown

This past weekend in Cleveland the Blue Angels were using 275.350 and 251.600. At the Latrobe/Westmorland Co PA airshow the Thunderbirds were using 141.850 and 322.600, with some support traffic on 413.100 (like, "Hey, get Jean-Claude Van Damme's autograph for Jim and I, too!" -- really! :-)). Note also that the 141.850 traffic was AM (glad I have a Pro-43!).

THUNDERBIRDS U.S. Air Force

Well, here goes... it seems to me (and correct me if I'm wrong) that the technology for capturing digital information and doing something with it is literally staring us in the face in the form of Soundblaster cards and their equivalent. I know one knowledgeable person in this group posted a program that will decode DTMF tones via the Soundblaster. What about the same thing for digital data that is criss-crossing the sky and waves?

Any ideas... anyone?

>bad nicads?

I have a set of nicads that I cycle into my Pro 43 that are over two
years old. At least once a week I let them completely discharge before
recharging. That way I avoid the memory problem. The 43 is much hungier
for electrons than my previous scanners, so I find that I have to plan
ahead. For instance, if there is a major brush fire near here and I'm
going to be running around and/or visiting the tanker base, I pop in a
set of alks for a couple of days.

(Brendan, I reposted my mail to you here for the possible benefit to others :-)

Brendan,

oak.oakland.edu seems to be one of the most popular ftp sites.

If you do a Veronica or other search and look for "ham radio", you will find there are about 50 more sites out there but not all of them discuss scanners.

You might also try some of the nationally known scanner BBS sites, such as:

*US Scanner News BBS- (206)695-0678
300-24,000 baud N/8/1 settings 24hrs.

*Grove's BBS- (704)837-9200, -5957, -7081, 5183 (4 lines)
5:30pm-7:30am M-F, 24hrs Sat-Sun

Good luck!

So, where was the Republican leadership? There was nothing stopping them from either (a) proposing their own amendments to defang the bill (and threatening a Senate filibuster if the Demos. refused to let them), or (b) proposing an alternative bill of their own and trying to win support for it. Such things happen routinely in Congress, yet neither was done in this case.

3933. RE: Superior Coax Cable- I hope this is the final post!

Newsgroup: rec.radio.scanner
Date: 1994-10-16 19:26:02 UTC
From: shawn4sk1@aol.com
Message-ID: <37ruoa$jkl@newsbf01.news.aol.com>
Source record: 267151

I think we all have a better understanding about what type of coax cable is best and if there's a FAQ for rec.radio.scanner, whoever is "in charge"- it would be a great idea to add the coax recommendation info to it, if it's not there already. Thanks to some of the members who read rec.radio.scanner, I have since changed my cable from RG-58 to RG-6 and have had a MAJOR, MAJOR improvement!

But guys, I see about 3-5+ posts a day discussing coax cable and which is superior. From this point on, could you please begin discussing this between yourselves and keep it off rec.radio.scanner. I am not writing this as a flame- again, without the posts, I would not have the range I have now. I just think it's getting a little past the general audience's interest and quite redundant.

>It's not clear that EFF actually got the cordless phone language inserted

>into the bill

It's clear they did no such thing. That provision was in the earlier
version of the measure last spring, at a time when EFF opposed the
measure altogether.

>I believe that a Federal Court of Appeals (if not the Supremes
>themselves) had found that there is no "expectation of privacy" for
>conversations on cordless phones, so there is no problem intercepting
>conversations held on them.

There was some pre-1986 federal caselaw to that effect. The 1986 ECPA
added an explicit proviso exempting cordless phone transmissions from
Title III's protections. Since then, however, a number of states
(Conn., NY, Calif.) have adopted new statutes (or readings of existing
ones) that extend protection to such communications.

A good rule of thumb is that if cordless comms are protected in your
jurisdiction -- which will be the entire US in short order -- then

there is a legal "expectation of privacy."

I own an AR 1500. It's a decent radio. The one I have has continuous coverage! Nothing is blockes out. I wish it had 1khz stepping though so the bfo could be finer.
I built several antenneas for it so we could listen to the shuttle mission being repeated from NASA's JPL. Well I had to go to Radio Trash and pick up a DX-380 for the week. The DX-380 did a better job, the AR1500 was getting swamped by a local AM Radio Station. The Radio Trash didn't. Do you have a problem with local radio stations when listening to SW?

I said that the rights erosion has accelerated under the Clinton Regime.
I have also said that the Democrats have controlled the congress since
1954. Do you have trouble with these facts?

I do not like the Republicans much better, if any. I am suggesting
it is time for massive change, and I suggest we do away with all
incumbents so they know that we know they have totally gutted
the Bill of Rights and that we will stand for it no more.

Actually you are mistaken about this, it definitely does something: it further restricts the type of equipment you can own.

Not the stated intent, but it does have an effect that is contrary to what the congresscritter Levin told his constituent. We either are being lied to by our representatives or they are too stupid to know what they are doing. Either way their time is over as far as I am concerned.

I WILL VOTE FOR NO INCUMBENT IN WASHINGTON, I SUGGEST YOU ADOPT THE SAME POLICY>

Thanks for a perfect illustration of my point. Three intelligent people who seem *UNITED* in their stand against restrictions on monitoring radio freqencies. However, are they united in their fight against restriction? No. They are arguing about what might be the underlying force behind the restrictions. Score 1 for the powers of darkness.

This discussion has been going on under so many different
headers that I thought I'd try a new one that maybe we can all
hold to.

I don't think voting folks out of office because we don't agree
with one position they take is very effective. Let's say I
like my congress member's voting record on every other issue
except his/her scanner legislation vote. Should I campaign
against him? I think not.

I suggest that the best thing to do is to contact our
representatives in Washington and express our concerns about
any future legislation that might hinder our hobby.

The kind of finger pointing at one party or another and name
calling that we've seen on this thread is, if you stop
and think about it, counterproductive, don't you think?

OK, I feel this has gone far enough. If ANYONE wants to talk about
how laser works, or how it doesn't work. Or how motorcycle cops hold on
to their radar when they're on their bikes, or how jammers, detectors,
detector-detectors, or jammer-detectors work, then POST THEM TO THE PROPER
NEWSGROUP!!!!!! In case you forgot to check when you entered this
newsgroup, it it REC.RADIO.SCANNER, which means that all postings should
have some basic connection to scanners. Please stop wasting our time with
these major off-topic postings.
Thank You.

Even voting the incumbants out has problems. Doing so this November will make Ollie North the Senator from West Virginia. How do you guess Ollie feels about the public monitoring government activities?

I don't know what the answer is, but I reckon its a bit more complicated then "Throw the bums out!"

Hello-

Anybody with info, would you please update us on the AR8000.

I've heard of some early bugs that have already been fixed, have anymore popped up ?

Also, is the unit living up to all its features and specs?

Greg

I am interested in monitoring US public service agencies located in the Blaine area near the Canada-US border. I have found freq lists to be highly inaccurate and vague re this region. For eg. the BC Freq List is very vague and inaccurate w.r.t. its Blaine listings. Radio Shock in the US has a lousy list for this area.
I live in Vancouver, BC and listen to
agencies "down south." I am especially interested in finding out how the ambulance service and paramedic service operates and what their freqs are. Also does the US Border Patrol have freqs other than 163.625?
So if you have any knowledge on this subject, I'd be interested in hearing from you.

Owning the scanner isn't illeagle (yet), just using it in your motor vehicle
in PRNY (peoples republic of New York). It is the local city cop, sheriff
or trooper who may inforce this law, as it is a Motor Vehicle & Traffic
infraction. As long as you are out of your car you are (read may) be OK. For
tomorrow who knows.

: : ALSO I thought the radar used in metropolitan areas were at least 25 WATT.

: No way. They are under 1 watt - with a horn antenna that amplifies the
: signal (by making it much more directive) by about 100 times. I seem to
: recall that they were around 100 mw - which would mean the effective
: radiated power would be about 10 watts - at the mouth of the horn.

This isn't right. The mouth of the horn is too close for the
gain to fully develop--you are still in the near field region.
Otherwise, you could run into the paradox of two horn antennas
being close together, and getting more energy out of the
antennas than you put in.

One of the curious things about really big dishes is that you
can reduce the field strength away from the dish by making it
bigger! Imagine a huge dish 1 mile across, perfectly built.
You will get a tremendous amount of gain at X band, but you
have to go so far away to see it that the field strenth isn't
really that strong. Not surprisingly, you can stand anywhere on
the surface of the dish and the field will be pretty weak.

Where is the most dangerous spot on the big dish?

At the feed--but the feed is really a little antenna without
much gain. Thus, you should really worry about stuff like
open waveguide and tiny antennas more than big horns or dishes
at microwaves.

The AOR 3000 and the AOR 8000 are the only AOR scanners that are worth buying.
The 3000 should be in a metal case, but for some reason they chose plasitc.
The plastic case does not seem to cause any problems though. My 3000A is more
solid than my R7000 when it comes to intermod, images, interference, noise,
etc. (the 8000 is a new Handheld that will soon be sold here in the USA).

He may be referring to the power-on problem that was fixed by adding a diode.
This fix has been added to current production units.

There was also a bug in the Audio Scan feature that AOR said they would be
fixing (this may be the squelch threshold problem you referred to).

So far, the units are not available in the US yet. Past due...

Many people really like this little radio because of its size/features ratio,
but the majority of people find it very frustrating because of its poor RF
performance.

From: nemo@gnu.ai.mit.edu
Message-ID: <37u32vINN9ss@life.ai.mit.edu>
Source record: 267093

I'm suprised to not have seen any reference to the Icom IC-R1
among the "Most Wanted Scanners" reports here. Actually, i own
one of these handheld wideband receivers and I'm quite satified.
(I don't work for Icom anyway ;). So i summarize here some specs,
hoping to be useful for a choice.

Coverage: 100 kHz ~ 1300 MHz continuos.
Tuning step: 0.5, 5, 8, 9, 10, 12.5, 25, 30 or 50 kHz
Memory chans: 100
Modes: AM & FM Triple-conversion; WFM Double.
Size: 49 x 102.5 x 37 mm (19 x 4 x 1.2 in)
Weight: 280 g (9.9 oz)

.. Skipping sensitivity & other EE's things .. (mail if curious)

It has six scanning modes, including auto-write, freq. skip.
channel priority, 10 scan limits and other nicenesses.
Separated speaker & line out. Internal 300 mAh batteries but
it is possible to add ICOM external battery cases.
I found it "used-few-hours" and payed about 400$.
If not sold in USA, should be easy to buy in other countries.

These are the frequencies restrictions from user manual.
USA, Australia, Asia: no restriction. (may be an OLD printing ?)
Germany: only ham bands. (...)
France: everyting EXCEPT 87.5 ~ 108 MHz. (O-la-la !)

Another international note: In Italy (where i live) an SWL license
is required to listen only to ham bands from your home.
It costs 20$ and looks nice hanging on the wall.

Easy listening!

-=-=-=

3967. Strange reception experience?

Last night I was listening to the Detroit, MI Police on my Pro 51 scanner when I began receiving the Buffalo, NY Police Department on 453.4250 (in Detroit is a seldom used detective band). This seems quite strange to me - Buffalo is quite a distance away! My radio is not modified (except via the keypad) and the antenna is the RS telescoping mast (with the coil) - replacement for the rubber ducky. Oddly, reception was better if I held the radio/antenna horizonally.

What did I experience and how can I replicate it?

Thanks!

l
>escoping mast (with the coil) - replacement for the rubber ducky. Oddly, reception was
better if I held the radio/antenna horizonally.
>
>What did I experience and how can I replicate it?
>
>Thanks!
>
What you experienced is a tempeture inversion that trapped the signals from
Buffalo and allowed them to follow the curvature of the earth to the Detroit
area. This is a common occurence especially over the Great Lakes region
when signalsppass over the warmer waters of the lake versus the cooler air.
Unfortunatly you cannot make it occur again since it takes several factors
of weather to make it happen.
You might also try and scan some of the ham frequencys and see how hams
react to other hams from 3 states away check into the local repeater system.

Thanks for a perfect illustration of my point. Three
intelligent people who seem *UNITED* in their stand against
restrictions on monitoring radio freqencies. However, are
they united in their fight against restrictions? No. They
are arguing about what might be the underlying force behind
the restrictions. Score 1 for the Powers of Darkness.

What do you mean by *break even*. Do you want what you paid for it?
Try a *starting* price around $200. A new unit went for $299 last
year before it was discontinued. Sale prices on similar *new* models
are usually $199. A used price of $250 is high, even with a charger.

> What about the
> same thing for digital data that is criss-crossing the sky and waves?

Yes, digital demodulation is on the current state-of-the-art
horizon. Any digital data can be piped into a computer and decoded
using digital signal processing (DSP) techniques. Thus, any RF wave
can be demodulated and "broken out" via software.

The next generation receiver is a digital radio, which I have worked
on. This radio is purely digital, no analog mixers, etc.
Getting another demodulator or customizing the radio is as
simple as changing the firmware. Going digital gives more
flexability and better performance in some cases.

How do these rumors spread like this??

First off, unless there has been a INCREDIBLE price increase since
April of this year, the 93C67 are $13.00 each, they might even be
less by now. Thats what they cost me then. It is true that you
can use the 93C66 (as I recall but don't quote me). It is also true
that you have to 'cross-wire' them to make them work. But they
are only 2 and a fraction dollars apeice.

When I designed the 400 channel mod, presented here a couple of times
and published this last spring in World Scanner Report,
I felt that trying to cross wire the cheap chip wasn't worth the
effort given how 'tight-for-space' the insides of the Pro-43 are.
Besides the 93C67 was a sure thing. I have never had any feed-back
from anyone else who has performed my mod, so for all I know my
Pro-43 is the only one in the world with 400 channels and a fade-away
lamp. Its still thriving for what its worth.

From some of the other post on this thread, its almost like my
re-post of the 400 channel mod a few weeks ago didn't
get to very many places. If there is demand, I'll post it again.

As for Digi-Key:
They have never had a min order. They do however place
a $5.00 handling fee on orders under $25.00 in addition to
shippping charges.

What do you mean by "Available"?

Because you can do nasty things with it, the RS232 interface may never be
sold in the US.

The RS-232 interface has been manufactured and shipped to distributors.
Javiation sells them to 80 pounds sterling. To date I know of no widely
distributed software for it,

Tropospheric ducting; during certain weather conditions, a "duct" is formed
in the atmosphere which guides VHF or UHF radio waves over the horizon.

You can't do anything to replicate it. All you can do is be there when
it happens.

>against him? I think not.

If a US senator wants to keep his job - he will.
The only time a US senator does not get to keep his job is if he makes so
many enemies in Washington, those in power there decide to throw him out.

(e.g. tax evasion, misappropriation, indecent personal behavior, etc,
or any of the other things they either did or didn't happen, but everyone
believes. They either resign or the manipulated public vote them out.)

The only other way is for the senator to decide to not run for reelection.

Remember when the populace was going to "throw the bums out"?
Only two incumbents who wanted the jobs failed to keep their jobs.
This is the reason they act the way they do. If you had guaranteed job
security, wouldn't you play the system as well?

I think that the system should be changed.
I agree entirely with Mr. Crisp on this issue.

>I suggest that the best thing to do is to contact our
>representatives in Washington and express our concerns about
>any future legislation that might hinder our hobby.

They don't even listen unless you have paid for their ear.
Again, the system needs to be changed. The guarantee needs to be challenged.

Source record: 267105

Hi. I have been monitoring some sort of pager/packet transmission which I'd like to try to decode. I am a reasonably good programmer but I suck at radio theory, so a little help would be appreciated.

What I have done is record the transmission using my sound card on my PC. So now I have a bunch of samples which represent the transmission. So far so good. I can display the samples (get pretty wave displays - fine). Can anyone give me some direction on how to decode this? All I really need to know is how a binary 0 or 1 is normally represented in a radio transmission. The rest I can do myself.

If you want to help, feel free to answer offline, or direct me to a good book.

>Thanks!

Sounds like case of troposheric ducting. An condition that creates a sort of "atmospheric waveguide" that carries VHF/UHF well beyond line of site - like Buffalo to Detroit, L.A. to Honolulu, wherever.

Mother nature did it and she is probably the only one that can replicate it for your purposes. It has to do with temperature inversions, moisture and maybe interest rates, etc. There actually isn't anything that I know of one can do to replicate a duct. I understand they can be predicted - I suppose if you want to dedicate yourself to such studies.

Skywaves (skip) and ducted signals don't always maintain their original polarity when they take this type of topsy-turvy journy which MAY explain the better reception when your antenna was horizontal. In addition horizontal polarization tends to reduce natural and unnatural noise.

3985. Re: Short PRO-43 Battery life?

Newsgroup: rec.radio.scanner
Date: 1994-10-17 23:21:33 UTC
From: norman@cs.toronto.edu
Message-ID: <1994Oct17.192132.2963@jarvis.cs.toronto.edu>
Source record: 267113

Here's a battery-life anecdote that some may find useful:

I travel by train a lot, and usually carry my Pro 43 along to keep track
of what's going on. A round trip from (say) Toronto to San Francisco
can easily involve 90 hours of listening, even if I don't use the scanner
at my destination (and I do, of course). If I used alkalines, that would
be a lot of batteries, at a lot of cost, inconvenience, and embarrassing
waste; hence I use rechargeables.

For most of such a trip, I am travelling in a sleeping car, where there's
a handy outlet into which I can plug my charger. I don't spend all my
time in the sleeper (it's a train, not an airplane or a bus: you can
get up and walk around), but I've developed the habit of keeping the
radio plugged into the charger whenever I'm there, and of course overnight.
This works fine; I've never had the batteries run out when travelling in
a sleeper.

But occasionally I have to take a long trip on a coach-only train, and
though most passenger coaches have an outlet somewhere, it's usually hard
to find and inconvenient to use (especially with something as big as a
typical wall-wart power supply). I usually get about eight hours of life
out of my rechargeables when I've charged them fully, but all-day coach
rides of 12 hours or so are not unusual (in fact they are almost inevitable
when connecting to the Amtrak system from Toronto). To deal with this,
I carry around a spare battery cartridge full of ordinary alkaline batteries.
When the rechargeables poop out, I swap to the alkalines; the next time I can
plug the charger in, I swap back. Because the alkalines are already installed
in a case, it takes only a few seconds to do the swap.

I am quite happy with this system; I've been using the same set of alkalines
for almost a year and a half (about 28000 miles) without grief. The
rechargeables do most of the work, of course.

I've thought about using a second set of rechargeables instead of alkalines,
but it hardly seems worth it if the alkalines last for several years.

I live in the Anaheim California area and recently purchased a copy of "Scan Fan". It contains alot of useful information about frequency useage in the Southern California area. This publication also states that many radio services (i.e. Orange County Sheriff and LAPD) are in the process of converting to an all digital modulation system. Does anyone know if companies that design scanners are going to provide digital modulation decoding in future products? Maybe it is not even possible to monitor digital communication? If it is not possible to monitor digital communication, the future for scanning could be very bleak.

3993. ELIMINATE ALT.RADIO.SCANNER

Newsgroup: rec.radio.scanner

Message-ID: <jim-171094182903@jimsmac.ttech.com>
Source record: 266961

Many newsgroups start out as an "ALT" group and then after gaining popularity are converted to a "REC" group. In all of the replies that I have received to my previous posting, it is indicated that the goals of both groups are identical. Therefore why waste the Internet bandwidth by posting to and reading from two newsgropus as many scanner hobbyists are currently doing?
Many hobbyists posting to alt.radio.scanner may not be aware of the existance of rec.radio.scanner. We currently have enough problems with government attempting to regulate what we can monitor. Why not form a single Internet alliance of scanner hobbyists in one newsgroup (rec.radio.scanner)?

: It's clear they did no such thing. That provision was in the earlier
: version of the measure last spring, at a time when EFF opposed the
: measure altogether.

: >I believe that a Federal Court of Appeals (if not the Supremes
: >themselves) had found that there is no "expectation of privacy" for
: >conversations on cordless phones, so there is no problem intercepting
: >conversations held on them.

The case mentioned above was whether the police needed a "warrant" to
allow evidence collected because a neighbor overheard a converstion
of a cordless conversation on his scanner. The "legality" of
listening was not at issue. It will ne interesting to see what
happens to future cases like this. Will someone report illegal
activity overheard on a cordless conversation knowing that the act
of such listening is now illegal. That probably won't happen anymore
because why would someone expose themselves to prosecution?

: There was some pre-1986 federal caselaw to that effect. The 1986 ECPA
: added an explicit proviso exempting cordless phone transmissions from
: Title III's protections. Since then, however, a number of states
: (Conn., NY, Calif.) have adopted new statutes (or readings of existing
: ones) that extend protection to such communications.

But, I don't know if those laws prohibit police monitoring or the
submission of evidence so obtained.

: A good rule of thumb is that if cordless comms are protected in your
: jurisdiction -- which will be the entire US in short order -- then
: there is a legal "expectation of privacy."

I don't think that's necessarily true. It will be true that it is
illegal to listen, but the courts may still take the view that
expecting no one will listen (given the ease of listening and the
millions of existing scanners) goes beyond any expectation of privacy.

>Warren Whitby
>wwhitby@aol.com
>73s de KE4ITL

It continues to sell quite well - simply because small size, features,
and overall coverage continue to make it a great scanner. Yes its
receiving in HF is bad -- I've found a good antenna/tunner/match/wiring
works to solve a lot of that problem. HF is low freq, therefore a LARGE
(long) antenna is best to get anything. I still can frequent most mid-high
power stations from 80m on up -- I've even had luck picking up a ship
beacon at 350 KHz with it (and I"m at least 15 miles from it).
Bad filtering on the input end makes close stations & harmonics
of stations stronger then they should be (they shouldn't break squelch).
I've also cured some of that with a good bandpass filter for HF band only.
Course this all ends up with a very stationary station.. another way
to get OK reception of lower frequencies is Radio Shack's antenna -- at
$10 it does OK, I can get the WWV/WWVH stations on 5/10/15 MHz as well
there's Radio Russia, Radio Austrailia, and a crazy preaching station
from the south.. just to sum up the low end reception I've been able
to get.
I've had fun with it -- now moving over to HAM radio.. scanning
gets old after awhile!

Sorry, I don't use rechargeable alkaline cells. The only impressive
testimonials I've seen are the advertisements selling them.

Instead, I buy ordinary alkaline batteries on sale, often Osco brand.
Most brands have been good performers, except the imported store brand
batteries bought from Walgreens.

It's 1994 and we're still using about the same batteries we did 25
years ago. Improvement in battery technology for the masses
remains a promise unfulfilled.

As another poster mentioned, buying an extra battery holder is a good
idea.

Pagesat has a version of it's UDI-1 interface that can receive faxes
from the Inmarsat marine satellites.Here is what is needed a satellite
receiver that can receive the Inmarsat signal in the 1540 Mhz range. The
audio signal is fed into the UDI-1 interface and RS-232 data is fed to your
computer.

The UDI-1 trains on the incoming rf data stream. A two way handshake
is not needed.

A limited number of these UDI-1 interface boxes are available for $200
each.. Also the appropriate software is meeded to decode and
display the fax is needed which is available by the developer. I do not
have a price on this software. However if you are interested I will put
people together.

I suppose the title says it all. Perhaps a kind and knowledgeable individual could give a more-than-basic overview of how these things work and how they would interface with a scanner.

A place to look for such a schematic (or if one could be provided as an example) would be very helpful.

Please, do not email- I must re-compile my newsreader, as my address is incorrect.

[... Stuff Deleted ...]
>converting to an all digital modulation system. Does anyone know if
>companies that design scanners are going to provide digital modulation
>decoding in future products? Maybe it is not even possible to monitor
[... Stuff Deleted ...]

It is certainly possible to decode digital modulation schemes. The biggest problem that I am aware of is that there are no standards for digital modes. Each vendor has their own proprietary, patented method.

I expect that like most technologies at first there will be no 3rd party equipment. As time goes on and patents run out official or defacto standards will emerge and 3rd party radios, including scanners will become available.

The question you should ask is what about encryption. As we move to digital modes encryption become easier and most business/police systems will probably move to it. Because it is illegal to decrypt transmissions not intended for you that will be the end of listening to these comms. There will always, however, be services that because of the nature of the communications will be open (i.e., aircraft, marine, etc.).

Radio as a hobby will always be around, but like always, the nature of the hobby will change. If you like fooling around with radio there will always be something to do!

4005. A few questions

Newsgroup: rec.radio.scanner

Message-ID: <9410181107.AA04874@pluto.me.adfa.oz.au>
Source record: 267119

G'day,
I'm fairly new to scanning in general, so I was wondering if I
could get a couple of questions answered, or least pointed in the right
direction to get some answers.

What exactly is a 'birdy
' ? My scanner manual mentions them, but isn't v. clear on exactly what they
are. Also, does anyone know about (or even own) a Uniden Bearcat 70XLT ?
I'm using one at the moment - it's basic, but quite nice to use.
And...finally (phew!) does anyone have any Australian frequencies that might
be interesting to listen to ?

Thanks muchly in advance.

Gary,

The RT-618 has been "around" since earlier this year.....I was
fortunate (!) enough to get a few when they came out. On paper
they look quite a nice unit...in real life...mmmm....well....
leaves a little to be desired.

A couple of Importers in the UK looked at the unit: we had some
(and I have some left...), SMC considered it and Icom looked at it but
nobody took the thing on board at that time, finally Lowes
started to bring the thing in...I don't think you will see it around
for long to be honest though. Its price is good at under 300 quid but for a
little bit more you have the Camnis '50/TR-2400 and a little bit
more than that the MVT-7100.

If your not too bothered about SSB then the MVT-7000 would be
a far better bet.

One major "stupidity point" is that whilst various increment
steps are avialable (1, 3, 5, 10, 12.5KHz etc) they are not
avialable accross the whole band, on top of this its a bugger to
drive.....

Maybe later versions might overcome the increment steps, then
again maybe not...mmm

Source record: 267120

You down or up convert a frequency by beating the incomming frequency
against a local oscillator. When you mix the two frequencies you
get two images. One image the difference the other the sum. Example:

400 mhz local frequency
869 mhz target frequency

Image 1 is 869-400=469mhz
Image 2 is 869+400=1269mhz

>schedules?

Several years ago I worked for a company that made transmitters and receivers
for tracking wildlife. I don't remember exactly what frequencies were used
but most were in the 160 MHz area. The highest freq I believe we dealt with
was around 216 MHz. We built some low band stuff that was implanted in fish
also. The frequency all depends on whose using it and the application.

Receiving the signals on a scanner is very difficult. The transmitters are
very low power, just a couple of milliwatts. Nor do they usually carry any
information. It's just an interupted CW signal. The only information I
recall we ever handled was movement and temperature. Those changes were
represented by changes in the speed of the CW keying.

Things may be different now - wouldn't doubt it. I worked for that small
company about eight years ago.

What is generally meant by poor RF perf. ? I can't figure by myself
because I owned this scanner only.

: What can one do that the other can't? What are their advantages?

The short answer is that shortwave listening is (mostly, there
are exception) concerned with long range reception--often,
international--of broadcast transmissions below 30 MHz (AM).
Scanner enthusiast are (mostly, this is the short answer) concerned with
the interception of short range point-to-point transmissions above 30MHz
(mostly FM).

4016. PRO-43 MEMORY UPGRADE TO FOLLOW.

Following this post will be two more that
detail the adding of 200 more channels to a
PRO-43 radio.
The first will be the text of the article.
The second will be a UUENCODED GIF showing
the circuits needed.
(check out one of the many binary picture groups
if you are unfamiliar with UUENCODING.)

I'm posting this 'annoucement' message in case
the next two post don't move through the NewNet
for some reason.

GET THEM NOW. I won't be able to repost
them all the time.

Good Luck, and enjoy the MOD.

BB

(PS. if someone out there actually does the mod, I'd love
to hear from ya. Esp if there were any places where
the instructions could be improved.)

Hears listening to ya.....

4017. Pro-43 400 CHANNEL MOD part 1 (LONG)

PRO-43 ENHANCEMENT
MEMORY EXPANSION & "FADE-AWAY" LIGHT
Brett Bennett 4/12/94
bbb@kuhub.cc.ukans.edu

INTRODUCTION

The following document details two enhancement
modifications that are possible on the Radio Shack PRO-43 scanning
radio. The first modification doubles the factory standard memory
capacity, allowing you to enjoy an additional 200 channels of memory,
plus 10 more monitor memories. After completing the first
modification, it is a fairly simple matter to add a 7 to 10 second delay
feature to the LCD back-light lamp circuit. I designed and performed
these modifications on my PRO-43 and they do work. As I understand
it, there (has been/is being) presented in WORLD SCANNER
REPORT a similar memory expansion. I have not seen this
modification and for all I know it is a better way of doing it. What is
presented is a 'clean-room' design of my own that to the best of my
knowledge is the only one to also offer a time-delay for the LCD back-
light. Having said that, let me say:

I ASSUME NO RESPONSIBILITY FOR ANYTHING THAT
MIGHT HAPPEN TO YOUR RADIO SHOULD YOU OR
ANYONE ELSE ATTEMPT THESE MODIFICATIONS.
WHILE REASONABLE CARE HAS GONE INTO THE
PREPARATION OF THE FOLLOWING DOCUMENT, I CAN
NOT GUARANTEE THAT THERE ARE NOT ERRORS.

The procedure described below is very complicated, and
involves the soldering and desoldering of very tiny components and
the cutting of printed circuit board traces. While the procedure is not
irreversible, it will leave permanent scars inside your scanner. It

should only be attempted by someone with moderate to advanced electronics experience. I don't think it should be attempted by, to quote someone else, a "weekend technician." If as you read through this you feel intimidated by the jargon and required procedures or if an electronic schematic looks like a strange piece of modern art to you, then this might not be the 'mod' you are looking for. The following document will assume you have obtained the materials listed below, especially the Service Manual, and you have studied the circuit in some detail. I will not describe in great detail where every component is or where every solder point on the logic board should be placed. Having the Service Manual, and having studied the drawings therein will allow you determine to where it is I refer.

REQUIREMENTS

1 - PRO-43 Service Manual. (Tandy Parts # MS-2000300 - approx. $6.00)
1 - CD4053 - Triple - SPDT analog switch - Surface mount package (DigiKey #CD4053BCM-ND - approx. $1.50)
2 - 93C67 EEPROMs (Tandy Parts # MX-8050 - approx. $13.00/each)
1 - 100k x 5 resistor network. Common lead type. (DigiKey # Q5104)
1 - UN2111 PNP transistor (Q1 on Logic PCB. Tandy Parts #)
1 - 1 uF 16v capacitor.
1 - 10 MOhm 1/8-1/16W resistor.
Misc.:
Wire wrap wire-30 gauge. (Radio Shack)
Grounded soldering iron with approx. 1/32" tip or smaller.
Desoldering Equipment.
Digital Volt Meter. (Used to double check your VCC and Ground connections, pre-check switching assembly)
Utility knife with fresh sharp small blade. (Needed to cut traces.)
Strong hand held magnifying lens. (Needed to check solder joints.)
+5-10 Volt bench power supply. (Used to check switching assembly.)
Anti-Static work place and grounding wrist band.
Very fine needle nose pliers, wire cutters.

THEORY

When studying the schematic for the PRO-43 one sees that the channel memory is organized using two 93C67 EEPROMS. As is common in microcomputer designs, the memory is all connected together on a common bus, with the individual memory devices being selected with a Chip-Select (CS) control line. The 93C67 are particularly simple, in that they are serial devices, only requiring 4 signal lines. (Data In, Data Out, Data Clock and CS) This inspired me to consider the possibility of adding two more EEPROMs, creating in effect a second 'bank' of 200 channels. One could then, presumably with the flip of a switch, choose between the original 200 channels, and a second bank of 200 channels. (In theory, this could continue to 600, 800, 1000 etc. channels. In practice however, space is very tight

in the PRO-43, and getting anymore memory installed would be very tricky.)

Switching two CS lines between two pairs of EEPROMs requires the equivalent of a DPDT switch. While it might be possible to do this with a mechanical switch, the physical implementation of this could prove to be very difficult. Rather than use a DPDT switch, I chose to use a CD4053 triple 2 channel analog multiplexer/demultiplexer. This CMOS analog 'mux/demux' can be viewed as a triple SPDT switch. Two sections of the CD4053 are wired in such a way as to act as a DPDT switch. The advantage being that a DPDT switch can be controlled with a SPST switch, and no actively switching digital signal lines need leave the area of the CPU. At this point one is still faced with the need of a mechanical switch to control the CD4053, albeit, only a SPST switch is needed. It was suggested to me by someone on the Internet, that the 'Keylock' switch might be a good candidate. And indeed it is! While it might be nice, once in a while, to be able to disable the keyboard, it is more than a fair trade to give this up for more memory. Thus I used the Keylock switch to control the DPDT switch made from the CD4053.

Good design dictates that the state of all signal/control lines are always in a known state. The 93C67's CS lines are active high leading to the need for pull-down resistors on all 4 CS lines. This insures that the 93C67's not currently being used will have their CS lines pulled to ground. I accomplished this with 100K ohm resistors connected between the CS line and ground. Physically I implemented this using a resistor array (SIP package) containing 5-100K resistors all having one common lead. The 5th. resistor is used to pull-down the CD4053 control lines making up the DPDT switch. This is necessary when the Keylock switch is in the open position (unlocked) since the line must be driven low.

This leaves a SPDT switch in the CD4053 not being used.

Studying how the lamp circuit works shows that the keyboard light switch grounds the base of Q1 to turn on the lamp. Using the CD4053 to act as the switch to ground, and placing a large RC time constant circuit on the control line of the CD4053 will allow for a time delayed lamp modification. Because the input impedance of the CD4053 is extremely high, a small valued capacitor and large value resistor will work. In my design I used as 1 uF tantalum capacitor and a 10 MOhm resistor to form the RC time delay. The Pro-43's keyboard light switch is connected across the capacitor to discharge it when depressed. This causes the CD4053 to switch on, grounding the base of Q1. After the switch is released, the capacitor begins to charge through the 10 MOhm resistor. When this voltage reaches approximately 1/2 VCC the CD4053 switches off, and the lamp goes out. (One caveat: When the radio is first turned on, the capacitor is discharged and therefore a lamp timing cycle will begin with each power up.)

PROCEDURE

**REMEMBER TO ALWAYS WORK AT A STATIC FREE WORK-
STATION, INCLUDING THE USE OF GROUNDED SOLDERING
EQUIPMENT AND THE WEARING OF STATIC REMOVAL
BRACELETS.**

The first step is to build the switching assembly. To build this first tin the leads of the surface mount CD4053 and the resistor array. Following the connections shown in the schematic (figure 1), attach short (3/8" to 1/2") pieces of wire wrap wire between the 5 resistor leads of RA1-NEW and pins 1,2,3,5, and 9-10 on the CD4053. (You should always: Size, cut, strip, tin and trim the wire before soldering it to the CD4053. Doing this makes it fairly easy to get good solder connections.) Connect the common lead of the resistor array to pins 6,7,8 and 12 of the CD4053. If done correctly you will have the resistor array laying flat on its side with its leads facing the CD4053 as shown in figure 2. This makes the assembly very thin. Inspect the solder joints with a magnifying glass, and give them a gentle 'tug' to make sure they are securely soldered. The PCB board drawing on page 19 of the service manual is an actual size drawing. Check to see that your assembly will fit into the area just above IC1 and to right of IC2.

Soldering to the pins of RA1-NEW, connect 4 - 2.5" lengths of wire to the resistor leads going to pins 1,2,3&5 of CD4053 (This makes up the 4 switched lines going to the CS pins.) Connect a 5" length of wire to the resistor pin connected to pins 9&10 of the CD4053.(This will go to the Keylock switch.) Attach a 2" piece of wire to the resistor lead attached to pins 6,7,8 & 12 of the CD4053. (This will be the ground connection.) Attach 3 - 4.5" long wires to pins 4,15,&16 of the CD4053. These will be the two poles of the switch and the VCC connection respectively. Finally attach 2 - 5" wires to pins 11 & 14 of the CD4053 if you intend to also add the lamp timer modification. At this point you should have a strange looking device with 11 wires sticking out of it. DOUBLE CHECK YOUR WORK AND SOLDER JOINTS AT THIS POINT.

The next step is to check the operation of the switching assembly. Using a 5-10 volt power supply, apply power to the assembly. Using a DVM, check to see that there is continuity between pins 4&5 and pins 15&2 while the control line (the wire attached to pins 9&10) is not connected to anything. And also check to see there is NO continuity between pins 4&3 and 15&1. If that checks, attach the control line to VCC. There should then be continuity between pins 4&3, and 15&1 and no continuity between 4&5 and 15&2. Next check for continuity between pin 14 and ground when pin 11 is grounded. The resistance between 14 and ground should become infinite when pin 11 is then connected to VCC. After check-out put the assembly aside in a static proof container.

Using extreme care bend all the leads, EXCEPT FOR PIN 3, of one of the 93C67 so that they are pointing as straight DOWN as possible . Bend pin 3 so it is sticking straight out from the body of the chip. These leads are very fragile and I suspect they will only accept a single bending before breaking,. After the leads are bent, carefully tin

all leads. Put the EEPROM back in its carrier, and repeat on the second EEPROM. The next step is to prepare the scanner for the switch assembly. From here on out, "The cheese becomes more binding," so work carefully and think about everything twice before doing it!

Remove the battery compartment lid and battery. Remove the 4 case screws and the back of the case. Disconnect the two wire connectors on the RF board. Desolder the antenna feed line and its ground connection. Remove the 6 screws holding down the RF board and remove it from the audio board. Disconnect the speaker wire from the audio board, and remove the 2 screws holding it to the front of the case. Separate this from the front of the case. Desolder and remove the RF-shield from the logic board. Wash your hands to remove as much skin oil as possible! Remove the screws holding the logic PCB. Turn the unit over, and with your hand supporting the PCB lower it from the case front. The reason for this is that the LCD assembly will stay with the board. If during this process the LCD and its backing glass do separate, handle them as little as possible. Also note the back-glass has a white frosted side. The frosted side, the light diffuser, is placed away from the LCD panel. Remove the rubber keypad, and locate the two traces running to the Keylock switch. Using a sharp utility knife, cut both of these traces near the switch, examine the cuts with a magnifying lens to make sure the switch is severed from the rest of the board. Avoid touching the keypad contact area as much as possible. Checking to make sure dust has not entered the LCD view area, put the logic PCB back in the front of the case and secure it with its screws.

Locate IC2 and IC3 EEPROMs on the logic board. Add to each of the pins on both chips a small amount of solder. This will be necessary to attach the new EEPROMs. Of course you must make sure that you form no solder bridges. At this stage I suggest you re-install the audio board and RF board. (There is no need to solder the RF shield back on, nor should you resolder the antenna connections.) By holding the battery in place and slipping the battery lid into proper position, it is possible to power up the radio without bothering with the case back. Check to see that all keys are functioning correctly except for the Keylock switch, and that the display looks normal. You are now ready to begin the 'fitting' of your switch assembly into the radio.

Locate the area just above IC1 and to the right (as being viewed from the backside of the radio) of IC2&3. There is a relatively open space here where the CD4053 and resistor array can lay. Cut a piece of thin card board stock to be slightly larger than the area taken up by the switch assembly. This will serve as an insulator between the logic PCB and the assembly. Keeping the assembly in its final position, start sizing the lengths of the wires. The wires connected to pins 1&2 of the CD4053 must reach IC3 pin 3, and the wires on pins 3&5 of the CD4053 must reach IC2 pin 3. Remember when cutting these down to leave enough extra wire for stripping, tinning and final trimming. The wire connected to pin 15 of the CD4053 must be long enough to reach the TRACE on the PCB going to IC3 pin 3. Likewise

the wire on pin 4 of the CD4053 must reach the trace running to IC2 pin 3. The switch control wire (pins 9&10 of the CD4053) must reach down to outside most solder pad on the Keylock switch. VCC, pin 16 of the CD4053, is sized to reach the 82 ohm resistor R26 located next to Q1. The ground connection can be made on the large copper area under the switch assembly after scraping a small area of solder-mask off. After the wire lengths have been determined, strip and tin the ends of all the wires and set the assembly aside.

Using a sharp knife, cut the trace running from IC1 to pin 3 of IC2. Repeat this for the trace running from IC1 to pin 3 of IC3. On either side of the cuts, scrape off a 1/8" area of solder mask and tin the exposed copper. Be careful not to damage any of the surrounding traces or components. Place the switching assembly in its proper location and solder the ground wire to the solder-mask free area you made near IC1. Attach VCC (pin 16 of the CD4053) to the top of R26. Attach the pin 5 wire to the cut trace that runs to IC2-pin 3, and attach the pin 2 wire to the cut trace running to IC3-pin 3. Next attach the wire on pin 4 of the CD4053 to the trace running to pin 18 (previously running to IC2-pin 3) of IC1. Likewise connect the wire on pin 15 to the trace connected to pin 19 (previously running to IC3-pin 3) of IC1. If done correctly you now have 4 wires running to the four 'new' connection points made by cutting the two CS line traces.

Connect the wire tied to pins 9&10 of the CD4053 to the outside (left side) conductor of the Keylock switch. Attach a new piece of wire to the center conductor of the Keylock switch. Size and connect the other end of this wire to center lead of IC5. (IC5 is low battery detector for the CPU. The center lead of this is connected to 5 volts which is sufficient to switch the CD4053. Later we will need to attach another connection to R26, and squeezing 3 wires to this single point would be tight so I used the 5 volt bus for switching.)

Place the insulator under the assembly and tape a corner in place so it will not move. Cut another cardboard insulator big enough to cover the switching assembly, and place this on top of the logic PCB. Bending the currently disconnected wires (pins 1,3,11,&14) in such a way that they don't short to anything (or each other) , install the audio board back in to the radio. Install the RF board and prepare to power up the radio. Making sure the Keylock switch is in the UNLOCKED position, turn the radio on. It should begin to scan normally. (Believe me you will breathe a big sigh of relief when it does!) Turn the radio off, move the Keylock switch to LOCKED position and turn the radio back on. You should see it either scanning frequency 000.0000 or the frequency field will be blank, with the channel counter incrementing. After a few seconds, the frequency number always blanked out and the am/fm indicators blinked randomly on my radio. If you are unable to make the radio scan correctly, there is something wrong with the switch assembly or your connections.

The next step is to install the new memory. The leads on the new memory are not long enough to reach the leads of the factory memory. Trying to solder bridge the gap is difficult accomplish

without also bridging adjacent pins. The best way I found to do this is to use tinned wire wrap wire. So the first step here is to tin about 6" of stripped wire wrap wire. Remove one of the new 93C67s from its carrier and place it on top of IC2, making sure that the extended pin 3 is over pin 3 of IC2. Put a droplet of solder on the tip of your soldering iron. While holding down the memory with a finger, apply the soldering iron to one of the corner pins of both ICs. The droplet should 'jump' over the gap between the pins and solder them together. Check both sides of the EEPROM to insure that all pins are accurately aligned. For the remaining straightened pins, proceed as follows: While holding the tinned wire wrap wire against the lower and upper pins, apply a freshly cleaned soldering iron tip to the gap area of the joint. The extra solder you earlier placed on the factory EEPROM will then be available to flow along the wire and solder to the pin of the new EEPROM. CHECK the joint with a magnifying lens. After a visual conformation of the joint, clip the wire close to the pin of the newly installed memory. If you like go back to the first pair you soldered and lay the wire into the molten solder. Repeat for IC3. Attach the wire connected to pin 3 of the CD4053 to pin 3 of IC2-NEW, and connect the pin 1 wire to pin 3 of IC3-NEW. Install the cover insulator over the switch assembly and prepare for a power up. With the Keylock switch in the Unlocked position power up the receiver. After insuring that the factory memory is still working correctly, power down, switch to the Locked position and power up again while holding down the 0 key and the Clear key. You should now see the radio scanning frequency 000.0000 for all 10 banks repeatedly. Press the PGM key to stop scanning and enter a valid frequency value and press enter. Press PGM, then the DOWN-ARROW, then PGM again. The frequency you just programmed should now be on the display. (At this point feel free to cheer! YOU have just added 200 more channels to your PRO-43. The next step will be the icing on the cake!)

This next step requires you to lift the BASE of Q1 from the logic PCB. (I found this to be very difficult, in fact, I ended up destroying Q1. Thus the extra Q1 in the parts list.) Desolder and lift the Base lead of Q1 from the logic PCB. Solder together one lead of R2, the positive terminal of C1 and the wire from pin 11 of the CD4053. Also from this junction, connect a wire to the solder pad on the logic PCB where Q1's base was connected. The area to the right of the Keylock switch provides a space where these components can lay. Connect the base of Q1 to the wire connected to pin 14 of the CD4053 switch assembly. The other end of R2 is connected by wire to the top of R26, this provides the charging voltage for C1. The negative lead of C1 can be connected to the RF shield ground pad near the Keylock switch. (Check that the RF shield will fit in place over C1. If it will not, place C1 so that its body is just below the bottom of the shield. Insulate the R2-C1 combination with electrical tape. Tape the switch assembly's top insulator cardboard in place and install and solder the RF-shield back onto the logic PCB. Prepare the radio for bench power up.

Turn the radio on, the lamp should come on. After 7 to 10 seconds the lamp should go out. Check in a darkened room to insure that the lamp completely extinguishes. Depress the light switch on the keyboard. The lamp should immediately light, and stay lit for 7 to 10 seconds after it is released. Install all the remaining screws for the RF board, solder the antenna lead and ground connections, and replace the case back.

USAGE

The light feature is self explanatory, and quickly finds itself useful in darken conditions. As noted earlier an unfortunate side-effect of the lamp circuit design is that the lamp will illuminate for 7 to 10 seconds every time the scanner is first turned on. (Maybe this is a feature to some.) Switching between active banks requires a little more thought. The safest way of changing banks is to: Turn the scanner off, switch banks, and then turn the scanner back on. But sooner or later you will switch banks while the scanner is on. When this happens you will see a curious event. The radio's CPU will continue to scan from the previously selected banks, but the frequencies scanned will now be those from the on-line EEPROM. This makes sense, since the CPU has no knowledge that its memory resources have been changed. Pressing the Manual button, followed by the Scan button, will cause the CPU to reload the scan banks that were last saved in the currently selected EEPROMs. Also any monitor frequencies that were stored are recalled. This allows you to set up two different frequency configurations, one in each bank of EEPROM. To change between them on the fly, just flip the Keylock switch, press the manual button, followed by the scan button. The only time I can foresee there being a problem is if some how one were to flip the switch while the CPU was doing a write to EEPROMs. Keeping this in mind you should never have any problems.

There are a couple of 'gotch-ya' that can happen when switching memory banks without cycling power. The PRO-43 loads the list of all locked-out channels only when it is first powered up. (This makes sense if you think about it. While I don't know for a fact, I assume that the Lock-out information for each channel is stored together with that channel's frequency in the EEPROM. If the CPU didn't pre-load the list of locked out channels, it would have to constantly re-read each channel to determine its lock-out status.) The side-effect of this is that it can cause the radio to appear to be randomly locking and unlocking channels when switching memory on the fly. The only realistic solutions appear to be to either cycle power when you switch memory banks, or use Lock-outs very sparingly. The Priority channel assignment is also loaded only when power is first applied. This can make the radio start checking the wrong frequency when memory is switched and the priority feature is used. The best way around this problem seems to be to assign the same channel number to be the priority channel in each memory bank.

CONCLUSION

Performing the described modification will provide the owner

of an already excellent hand-held scanner, the convenience of a total of 400 channel memories and 20 monitor locations, doubling the factory capacity for under $40.00. It also provides a "fade away" LCD back-light with a 7 to 10 second delay. The bank switching nature of the design allows for the user to program two unique 'personalities' into the scanner selecting between them with the Keylock switch. The modification while complicated can be performed by any person with moderate to advanced electronics experience.

I don;t know about the other states, but the California law
was specifically passed to prevent the police from using info
gained from listening t? cordless to build a case. The legislation
was a reaction (as is often the case in the knee-jerk, reactionist,
Democratic Peoples Republic of California) to a story that came out
in 1989 where it was reported that the IRS advised field agents to
use cordless derived information to help build tax cases against
cheats.

This really annoyed the statehouse commies in California, and on the
heels of the illegal assault weapon ban the enacted as a reaction
to the Patrick Purdy schoolyard massacre in Stockton, they just passed
another illegal intrusion into the rights of their citizens.

Of course in less than 3 weeks we can send a clear message to the
rights grabbing Democrats and Republicans (what few there are left
in government) that we will stand for this foolishness no
more. Of course if you want to vote for Fineswine or the rest
of her ilk (Liberal democrats which love to pass opressive legislation),
then we will get more of the same.

The choice is yours. We all get to wallow in the same mud.

I read both groups and find the hackers with the interesting information are
on teh alt group, while the newbies with questions like "what is the difference
between a scanner and a TV" are on the rec group. Lets keep them separated.

not only that, but the feds have made it illegal to have you receive
digital modulation. Furthermore since we will not be able to monitor the
police, they will be able to say what they please with no worry about
being monitored. Just think of the abuses they will commit! THE Rodney
King "gorillas in the mist" comment will seem tame in retrospect.

>What can one do that the other can't? What are their advantages?

Generally SW radios go from 50Khz to 30Mhz.
Scanners go from 30Mhz to 1Ghz.

Scanners frequencies are to high to "skip" off the atmosphere, so pickup
is direct line of sight, limiting distance to 40 miles at best. You can
pickup airplanes, police, fire, FBI, ambulance, cordless phones,
cellular phones, taxi's, bus's, ...

SW radios work best at night when "skip" is best. You can here radio
stations on the other side of the earth. There are several countries
that have excellent news programs; Germany, Netherlands, Australia,
England, USA, Canada and many other small countries.

SW also carries weather faxes, news via RTTY, Hams from around the
world, hams transmit pictures via SSTV you can pickup.

Seems most people start with a scanner and a progression occurs.

scanner -> SW radio -> Ham rig -> 4 wheel drive vehicles -> assault weapons
-> amassing stock pile of ammo -> confrontation with federal authorities

David Koresh started out with a lowly PRO-34.

: RobertPincus wrote: : Hi,
:
: : For us Newbies, what are the differneces between scanners
: : and shortwave radios?
: : What can one do that the other can't? What are their advantages?
:
: The short answer is that shortwave listening is (mostly, there
: *are* exception) concerned with long range reception--often,
: international--of broadcast transmissions below 30 MHz (AM).
: Scanner enthusiast are (mostly, this is the short answer) concerned with
: the interception of short range point-to-point transmissions above 30MHz
: (mostly FM).

In addition, "scanning" refers to a way frequencies are tuned on
a radio, regardless of whether it's a shortwave radio, VHF, UHF,
or even microwave receiver. In fact, many shortwave radios
can act as scanners on the shorwave bands. Scanning, strictly
speaking, is a method of automatically and rapidly tuning through
some set of predefined frequencies, set up as channels. When
something is transmitting on a channel, the scanner stops, then
resumes after the transmission stops. Whereas, a common way
to tune a shortwave radio is either with a knob, or, with
up/down slewing buttons, or direct entry of the frequency.
And, yes, some scanners even allow you to tune the radio
with a knob, just like a shortwave radio (using what's
called the VCO), although less convenient.

But in general, yes, scanners as we mostly refer to them
receive generally from 30MHz to 2GHz depending on the model,
and shortwave (perhaps these days called "world band") radios
pick up stuff below 30MHz, down to about 100Khz, depending
on the model.

Mike

Well, I don't know about the conspiracy stuff ... :-)

>This is the reason they act the way they do. If you had guaranteed job
>security, wouldn't you play the system as well?

Agreed. I used to be against term limits - I still think that the best
term limit is the ballot box. The 103rd Congress, among other things, has
caused me to change my opinion. Think of the money we'd save if we didn't
have to pay these waesels a pension!

Remember, too, if it weren't for the two-term-limit on the presidency,
we'd be half way through Reagan's fourth term!! (taxes would be
non-existant but the debt would be $8*10^12 instead of $4.5*10^12,
hundreds of invisible bombers would be flying around under the peace
shield ...)

Anyway, my point was that as CONgress passes more and more unenforceable
laws (i.e. cell- and cordless phone monitoring ban, etc, etc ad nauseum),
more and more people will lose respect for *all* law. This is the biggest
danger, IMHO, of these senseless laws, not the loss the immediate loss of
freedom. That's not to say the loss of **ANY** freedom is a trivial
matter! Just that the long term view is even more frightening ...

:poor RF performance...

A big DITTO there! I have an R1. It is small and feature packed, but
the manual is a collection of useless icons, and apparently the scanner
doesnot *scan*. It only searches! How do I scan frequencies in memory?

The earphone is subordinate to the volume control and cuts-out the
internal speaker. The line-out is *also* subordinate to the volume control
but doesn't cut-out the internal speaker. Isn't that curious?

Has anyone else noticed that the Nicad internal battery has a shelf-life
of about 24 hours?

Could another R1 user give me a clue about scanning, I obviously don't
have one.

thanks

>times on a daily basis:

>"If you are posting to alt.radio.scanner, please post to rec.radio.scanner
>so that we can eliminate alt.radio.scanner and have one scanner newsgroup.
>Thankyou for your cooperation."

Nope, all you will do is continue the viability of the newsgroup by maintaining message traffic on it. Many sites decide whether or not to carry a newsgroup by how long it's been idle (matter of fact, there is a regular posting to news.lists that identifies such moribound newsgroups) or on its estimated readership or measured message activity (another news.lists posting). In addition, many will disagree (for reasons ranging from an opinion that alt.* groups should never die, to silliness like a reactionary resistance to doing something because "someone told them to do it") and will defy your wishes purely out of spite.

The newsgroup alt.radio.scanner is not going to go away by turning it into an alt.radio.scanner.meta-flames.about.why.this.newsgroup.should.be. deleted. Just accept the fact that you're not going to get thousands of sites and users synchronized in any short period of time. The trend is towards moving from alt.radio.scanner to rec.radio.scanner, let's just quietly let it happen and it will happen more quickly with a minimum of fuss.

This does, however, teach a very strong lesson about taking the trouble in the future to go through a "Big-7" newsgroup creation process for a group that could potentially become quite mainstream, rather than go the easy way out by arbitrarily newgrouping an alt.* group (which has the potential to make messes like we're dealing with here now).

>I would appreciate replies and help from anyone and everyone. I am tired of
>reading two newsgroups for no valid reason!!

Then don't. Just unsubscribe from alt.radio.scanner, don't read anything on it and don't post anything on it. If enough people do that, the problem is all but solved.

Want something for nothing, huh? Wouldn't we all!

When you say "Mobile Phones" which types of phone are you talking about? The "old" pre-cellular "Mobile Phones" in the VHF & UHF bands or new "Cellular Phones"?

You aren't going to find anything worth spending your money on, cheap. Generally scanners that have the capability to monitor the frequency ranges of Cellphones are even more expensive than scanners w/o the capability. Somebody I'm SURE will correct me if I'm wrong, but the high in frequency any receiver, tranceiver, transmitter is capable of the tighter the tolerances, quality of components must be higher to guard against drifting. etc. etc.

>
>What is generally meant by poor RF perf. ? I can't figure by myself
>because I owned this scanner only.

1. Poor dynamic range (overloads) - that's why it's intentionally packaged
with a low-gain duckie.

2. Poor ultimate rejection due to reciprocal mixing of spurs from the CPU.
In plain English it means that you get internally-generated false signals
which interfere with scanning, searching, and identifying the true
frequency of a signal you stop on.

3. Poor adjacent channel selectivity due to substandard IF filters ...
chosen for tiny size and cost rather than performance.

Sets like the R-1 or Alinco DJ-X1 are excellent for covert listening and
travel, but I wouldn't want to rely on them as my primary rigs.

4045. AR1000XLT info needed....

Newsgroup: rec.radio.scanner
Date: 1994-10-18 21:48:52 UTC
From: terupe@waikato.ac.nz
Message-ID: <1994Oct19.104853.34388@waikato.ac.nz>
Source record: 267222

I have just recently acquired a AR1000XLT, scanner.
But it came with no manual, I know the basic operation of how to
program in limits and to search and scan, but is there anything
else that I am missing out???
I would be enternally gratefull if someone knew of a FAQ for this scanner
who even mail me a copy of the manual, I would repay services.

One other question:
Seeing that this scanner has such a huge range of coverage, would
different antennas be better for different frequencies????
I am interested in the Freq range from 8MHz - 500 MHz.

I got a modifiable Pro 43 yesterday at the RS at the Stanford Shopping Center in Palo Alto. I got the last one. Sorry about that, everyone. The downtown Palo Alto store clerk told m they sold out their last (demo unit) modifiable Pro 43 about three weeks ago.

It's possible that other Bay Area stores still have modifiable units. I located mine by telephone calls. Whatever you might or might not say about RS salespeople, they understood why I wanted a non-A-serial number unit.

I have just bought an Pro-2035 so I a getting rid of my
Pro-2021 scanner

Description below:

Radio Shack Scanner: Pro 2021 $150 plus s/h

Realistic Pro-2021
VHF/UHF Direct Entry Programmable 200 Channel Scanner Radio

This programmable radio is in excellent condition, yes fully functional.

You'll have access to over 23,000 frequencies!

Features include:

o Ten 20-channel memory banks
o One 10-channel monitor bank for temporary storage and priority freqs
o Rapid transfer from Monitor to Permanent Memory
o Large multi-purpose LCD shows which channels and frequencies are being
scanned, monitored, programmed, as well as the status of the channel
and operation mode of the PRO-2021.
o Provides optional two-second delay to eliminate missed replies on
any channel.
o Holds memorized frequencies with internal 9-volt battery backup

o Covers 30-50 MHz (VHF Lo)
50-54 MHz (ham radio 6m)
108-136 MHz (aircraft)
138-144 MHz (government)
144-148 MHz (ham radio 2m)
148-174 MHz (VHF Hi)
380-450 MHz (ham radio and government)
450-470 MHz (UHF Lo)
470-512 MHz (UHF Hi)
o Built-in internal speaker
o External speaker jack
o BNC external antenna connector
o 120-volt AC operation with power cord
o 12-volt DC power jack for automobiles and RVs (negative ground)

Mobile mounting bracket can be purchased at your local Radio Shack store.

Includes owner's manual and telescopic antenna.

Price: $150 plus s/h

If interested just email to jamesb@clark.net or
you can call at (410)969-7676.
If not home just leave msg on machine and I will return your call.

I may suggest as well that skip may have actually have been the source
although ducting is more likely.
However the aurora borialis was clearly visible during the evining hours
of Columbus day weekend.

So auroral skip may have been the culprit.

If the signals persisted for a long time (hours) then it may have been
the cause. Ducting seldom lasts for more than an hour.

Auroral skip persists as long as the aurora does.

In either case, Nice catch.

steve

One contemplating doing this should note that the law varies by state.
In Washington, for example, there are fairly strong privacy laws that
limit recording without consent of all parties.

>PN> they were really sorry, and that the cb was supposed to be shipped back
>PN> for repairs.... Ahh well.. Everything I ever bought from Radio Shack
PN> crapped out within 2 weeks.... Paul

Sorry to quote your whole message, Paul, but I was confused by it. You say at
one point your friend bought a CB. Later, you buy a scanner, but it turns out
to be the CB your friend bought. The radio shack guy threw a scanner back into
> the box (he also was confused, evidently). But in the end they were sure it
> was the CB that was to be sent out for repairs. When you get this story
> straight and/or quit smoking those funny cigarettes, let us know what really
> happened. :) Maybe the reason your equipment "craps out within 2 weeks" is
> that you forget what it was really supposed to do. :)
> Best wishes from Richard

After reading his post, I figured out what happened. His friend buys a
CB, and after using it for a while it somehow turns into a scanner. He
returns it to Radio Shack for another CB. The Radio Shack sales person
looks at the scanner, and it seems O.K., so he sells it to Paul. After
Paul buys his expensive $350 scanner, he uses it for three hours, and
then it turns back into a cheap, $50 CB radio. This is very simple, and
can happen to anybody, as you can see. All it requires is some knowledge
of the basic laws of physics. Heck, it happened to me last week. I
bought a new Mercedes Benz, and parked it in the garage for the night.
I opened the garage the next morning, and saw the whole thing turned into
a Hyundai. I'm now having a hell of a time trying to return the car to the
dealer, and I just can't figure out why.

Scanner cases? I got mine direct from the manufacturer. I've been happy with it. NOthing fancy 1/8 neoprene, and heavy nylon... nylon strap closes with velcro across the top of the case. I believe that i paid 18 dollars little over a year ago. There are no cutouts for the keypad or speaker, but this hasnt been a problem for me. You can reach the manufacturer at 800.727.6824 i think that its 1.800.72-POUCH. It might be good for you to know the approximate dimensions of the scanner you want to fit, as this guy doesnt make his product specifically for the scanner market. He does however know how to fit the major models

Good luck

: --
A cheap way that might work if you're using a TV/FM antenna (mounted
horizontially) is to turn the antenna so that the null (area of low gain)
is pointed at whoever is causing interferance.

: : No way. They are under 1 watt - with a horn antenna that amplifies the
: : signal (by making it much more directive) by about 100 times. I seem to
: : recall that they were around 100 mw - which would mean the effective
: : radiated power would be about 10 watts - at the mouth of the horn.
:
: This isn't right. The mouth of the horn is too close for the
: gain to fully develop--you are still in the near field region.
: Otherwise, you could run into the paradox of two horn antennas
: being close together, and getting more energy out of the
: antennas than you put in.

The point was, that would be the erp. The actual power is still
100 mw. Whether the erp is developed at the mouth of the horn, or
500 feet away is immaterial to the argument.

: One of the curious things about really big dishes is that you
: can reduce the field strength away from the dish by making it
: bigger! Imagine a huge dish 1 mile across, perfectly built.
: You will get a tremendous amount of gain at X band, but you
: have to go so far away to see it that the field strenth isn't
: really that strong. Not surprisingly, you can stand anywhere on
: the surface of the dish and the field will be pretty weak.
:
: Where is the most dangerous spot on the big dish?
:
: At the feed--but the feed is really a little antenna without
: much gain. Thus, you should really worry about stuff like
: open waveguide and tiny antennas more than big horns or dishes
: at microwaves.

Or, anywhere close to the horn - between it and the dish.

4066. San Jose Area Man busted for Cell phone cloning

Newsgroup: rec.radio.scanner
Date: 1994-10-19 06:51:29 UTC
From: crisp@netcom.com
Message-ID: <crispCxwr1t.2zp@netcom.com>
Source record: 266996
Cross-posted to: alt.radio.scanner,rec.radio.scanner,rec.radio.shortwave

I just heard a report on CNN about a guy in San Jose, Ca that was busted today for cloning cell phones. According to the report, the man used a computer controlled scanner to intercept data and stored it in computer chips (geez what a horribly un-technical explanation designed to be digested by the average 70year old or 3rd grader).

So there we have it guys, the radio equivalent of Patrick Purdy massacring children with an AK47 in a schoolyard in Stockton.

Now how sympathetic do we think one of those scumbag politicians will be when we try to explain that they need to repeal the provisions in the digital telephony bill prohibiting the illegal combination of computers, software and radios? Especially when we get to the part that all of the crimes this guy committed were crimes without the new digital telephony bill. Hell I will lay better than even odds he was indicted without using the new provisions of the DT bill!

Score one for darkness today!

Hey Bill,

I hate to break your bubble about radar jammers being illegal, they are not!
If you check the FCC rules, you can tx <5 watt's and be legal. Reading last
months Car Stereo, I think that's the name, they reviewed a radar jammer. It's
a combo detector/jammer. The detector sample's incoming RF, shifts the freq.,
and retransmit's it at less than 5 watts. Therefore no restrictions.
Although I believe it would still be illegal in Va., due to it being a radar
detector.
If you have any question's about it, I'll try to dig it up and fax you a copy
of the article.

4068. Yupiteru VT-225 LCD Backlight ON-OFF-ON-OFF...weird!

Newsgroup: rec.radio.scanner
Date: 1994-10-19 07:19:52 UTC
From: yc23@gec-mrc.co.uk
Message-ID: <5567@gec-mrc.co.uk>
Source record: 267004

The LCD backlight on my 225 operates in a very strange way and I wondered if any other users had seen this effect - maybe it's intentional for some reason.

Press the backlight button and keep it pressed and the light stays on for about 3 seconds - off for a second - on for 3, off, on for 3 etc...

However - sometimes it stays on for as long as you keep the button pressed - with subsequent presses giving the 3/1/3/1 behaviour.

It's already been back to my local UK distributor who fixed another small problem and either couldn't see any backlight problem or reckon this is normal.

Have you seen this effect? - it doesn't seem to be a problem with the button itself.

Thanks

> ... a list of freqs for the Appalachain Trail.

The AT is maintained by volunteer clubs and individuals, coordinated thru
the Appalachian Trail Conference
Washington & Jackson Streets
P.O. Box 807
Harpers Ferry, WV 25425-0807
(304) 535-6331
One of the maintaining groups is the Appalachian Mountain Club (AMC), which is responsible for 118 miles in Maine & New Hampshire. The PA/MD/VA areas would fall under the Keystone Trails Assoc, the Potomac Appalachian Trail Club, the Tennessee Eastman Hiking Club, and 9 smaller groups.

While the National Park Service and the U.S. Forest Service (and their state equivilents) would have radio frequencies in use in areas crossed by the AT, usage would be light at best. Most people in these services signed up to get away from just that sort of thing <g>.

Given that AT hikers have been known to strip the cover off a book of matches to save weight, carrying a scanner on the trail may not be the best idea. I'm afraid my two favorite recreations have diametrically opposed philosophies.

Hey, guy...you have 2 senators and a representative. You have a
computer and, I assume, a printer. If you're going to scream at RS for
your lack of action, then you better start screaming at Uniden, AOR, and
everyone else who caved in.

SB>So let them get stiffed with the junk. The above should fix any out of
>warranty problem for free and they OWE us for their obedience to the FCC.

Try again, Steve. RS owes you one year on a scanner, 5 years if you buy
the extended warranty. They also owe you nothing if you fry your
scanner making mods on it. And, BTW, please, PLEASE try to do what you
outlined above in my store...we've had people return their old stuff in
new cases/boxes. Sometimes it's not even RS brand. They usually feel
good about ripping off a large corporation for a few days, until the
police show up on their doorstep with a retail fraud warrant (If the
return was over $200.00, it's felony retail fraud). They have to hire a
lawyer, go to court, and a couple have done time in the county lock-up.

I would like to know why David Price from North Carolina is on your hit list? This doesn't seem right, he came and spoke to the local Raleigh ham radio club just last month and was knowledgable and supportive of radio hobbyists. In fact, the ARRL lists him as one of the good guys who supports ham radio! I live in Raleigh, and am Assistant Section Manager for NC and think Price would be much better than his opponent. His opponent is the former chief of police in Raleigh, and my guess is (and this is only a guess) that from his background he would prefer that scanners and such be taken away so you cannot listen in on the police.

So, where did you get your information!?

:>Date: Mon, 17 Oct 1994 17:05:02 -0800
:
:[... Stuff Deleted ...]
:>converting to an all digital modulation system. Does anyone know if
:>companies that design scanners are going to provide digital modulation
:>decoding in future products? Maybe it is not even possible to monitor
:[... Stuff Deleted ...]
:
:It is certainly possible to decode digital modulation schemes. The biggest
:problem that I am aware of is that there are no standards for digital modes.
:Each vendor has their own proprietary, patented method.
:
:I expect that like most technologies at first there will be no 3rd party
:equipment. As time goes on and patents run out official or defacto standards
:will emerge and 3rd party radios, including scanners will become available.
:
:The question you should ask is what about encryption. As we move to digital
:modes encryption become easier and most business/police systems will
:probably move to it. Because it is illegal to decrypt transmissions not
:intended for you that will be the end of listening to these comms. There will
:always, however, be services that because of the nature of the communications
:will be open (i.e., aircraft, marine, etc.).
:
:Radio as a hobby will always be around, but like always, the nature of the
:hobby will change. If you like fooling around with radio there will always be
:something to do!
I'll go out on a limb here and make a prediction. Instead of getting
dedicated circuity decoders, like the M-400, you will instead get a DSP
chip with variable programming. There will be either ROM modules and/or a
computer interface to change the mode of demodulation. The computer interface
will be more powerful, as the demodulation code can be traded between users
via a modem or floppy. This will be a new zone of piracy as hackers run
overtop of proprietary standards by reverse-engineering their protocols and
sharing their resultant modules with their friends. And with the increasing
growth of the internet, BBSes and communications technology in general, it
will be impossible to stop. (sort of like scanning cordless phones)
Don't get freaked out by new technology. Control structures, by their
very nature, are never the first to discover/use new technology. It's the
hobbyists and hackers like you and me.

I had a call from a fellow in NC that told me that even though Price talks a good line, that he voted for the DT bill and therefore earned his place on the hit list. I am only putting names on the list that people care to mention.

From my own perspective, anyone that was in Congress when the DT bill was passed by unanimous voice vote is on the list. They have their fingerprints all over it.

If they voted for the crime bill, then they have two strikes against them. I like this three strides you're out stuff: I say the third strike is a pre-emptive one.

Thanks for telling us the law in Washington. The thread originated in
a complaint about a sleazy and despicable business practice adopted
by some cell phone retailers in California.

Note that the suggestion I made about wearing a wire was one of
physically concealing a recording system on one's body, physically
going into the store and taping the clerk's comments which several
of us have noted run afoul of the California business code.

If you want to do this in some other place, check local laws.

Would this be illegal in Va? Howabout a combination Scanner/Detector (like the Trident TR33mumble)? I was under the [potentially false] impression that the law prohibited the use of equipment, the sole purpose of which is to alert the user of the presence of police radar. Hmmm, so are laser detectors illegal in Va also?

If you check the FCC rules, there's nothing prohibiting MURDER, either.
But it's still illegal. You just have to look in the right rule book.

4085. Cell Phone Cloner Bust in San Jose

Newsgroup: rec.radio.scanner
Date: 1994-10-19 15:09:26 UTC
From: crisp@netcom.com
Message-ID: <crispCxxE3q.J10@netcom.com>
Source record: 266946
Cross-posted to: alt.radio.scanner,rec.radio.scanner,rec.radio.shortwave

The San Jose Mercury had an article int he October 19 issue about the Mr Watson, the fellow that was arrested for cloning cell phones.

They state that he was responsible for about $500K worth of fraud over a three month interval, that he had written a program to assist in the cloning and that he had sold the program for as much as $60K in the far east (Singapore).

They also mention that he was indicted on three counts of fraud.

--

Note that the acts he committed were illegal without the help of the "computer controlled scanner ban" I say is a part of the DT bill. Note also that the cell phone system as it exists today is wide open.

This was known to the designers of the system at the time it was deployed. Note also that the ban on certain combinations of computers and scanners codified by the Digital Telephony Bill recently passed by the Democratic Majority of the House and Senate and signed into law by Bill Clinton, is a feeble attempt to lock the barn after the horse is stolen.

Basically in very crude terms, the current cell phone system in use here and in other parts of the world is somewhat analogous to banks storing money in cigar boxes and now several people have figured out that it is not locked up and are dipping in to help themselves of the free cash.

Clearly this is illegal and immoral, but if the cell phone service providers were not so criminally stupid, there would be no reason to have to send their lobbyists up to the hill to line the pockets of the purchasable Congresscritters (bascially they all are) to get legislation passed that infringes your and my liberties to possibly compensate for their stupidity and greed.

What if store owners did not lock ther stores at night? Well you and I both know that someone would open up and help themselves to the goodies offered for sale. One way the store owners could prevent this is by getting a law passed that made it illegal for anyone to be out past a certain time in the evening. If you are out past dark, you go to jail.

Clearly this would be a gross infringement of civil liberties, and clearly the solution to the merchant's problem is simply locking up his store. The situation with the cell phone fraud and the digital telephony bill is similar to the hypothetical case outlined above.

We must demand that our representives actually represent us, and pass bills that make sense, that have a need and are effective at addressing the issue at hand. WE cannot permit them to continue serving in their jobs as the tool of those with deep pockets, lest we wind up with laws the require us to keep off the streets at night, when a simple lock will do.

Send a very strong message to your elected representatives by not re-electing them.

--

By the way, one gentleman from Brandeis University suggested that we would wind up with ineffectual representation in WDC if we had only freshman congressmen. I point out that we have a freshman President, a pair of freshmen senators from California that have been successful at passing their liberty stealing agendas, and that many other states are in the same situation with new blood on capitol hill.

Maybe he has been listening to Teddy Kennedy's rhetoric for so long that he has not even considered that it may do Mass good to have new representation in Washington.

THROW THEM ALL OUT OF OFFICE!

You should also try shortening the antenna down to its lowest extension or
retracting it entirely. That coupled with the squelch control being
adjusted has worked very well for me to the point where I can completely
block out high-powered locals.

> ... tried soldering a 9V battery clip into the Pro 39/43 battery holder?

There doesn't appear to be much to gain. At 100ma load (a PRO-43 at moderate volume) and a 6.0v cutoff point, a 9v alkaline might last 1-1.5 hrs (vs 20+ for AA alkalines). Two 9v batteries would weigh 3.3oz (plus switch & connectors), vs 5.0oz for 6 AA cells & holder - a saving of 1.7oz out of 14oz total.

You should have seen the 12v lantern battery I used with a PRO-2005. Now _there_ was a handheld radio! (errr ... actually two hands and a couple of shoulder straps).

A long time ago I was told by my father that one did not discuss politics
or religion with friends if one wanted to keep them as friends.

I have offended many of my long time friends on the net by taking
a rather outspoken position regarding the impact of the current
administration on my perception of what is right and wrong for this
country.

As you all know by now, I am no fan of Bill Clinton or Dianne Feinstein.
I vehemently disagree with every major policy they support. I also realize
that there are many of you who don't feel the same way I do.

Finally I realize that most of you that disagree with me on this would
otherwise find much common ground with me on many common interests and
my taking a very public position attacking those that they admire has
put an enormous strain on our otherwise good friendship.

So being a person that is adaptable, and one that values the friendship
of others, I would like to take this time to publically apologize for
the comments I have made in general in this forum if they have hit
a raw nerve or angered you in any way. And I would like to specifically
apologize to Don Moore for asserting that his loyalty is directed to any
country other than ours. I was wrong to do this and have no trouble
publically admitting it.

I realize that Don is not likely to read this, as he has now placed me
in his kill file, but hopefully this note will find its way to him anyway.

I will now cease to attack Bill Clinton, Dianne Feinstein and other Democratic
members of our Federal Goverment in this forum and will get back to the
business of radio, having the burden of saying what I did and believing
what I do.

Without making specific recommendations about who to vote for on Nov 8
I will say that we should remember that our only indicator of future
performance is past performance and that a leopard seldom changes its
spots. So when it comes time to vote, remember what you have been dished
in the recent past and vote the way your heart tells you is right.

73's and happy listening.

>freedom. That's not to say the loss of **ANY** freedom is a trivial

That is a very good point that I believe is often overlooked. When unjust
laws are passed you and I may have the temptation to decide which
laws we will obey and which ones we ignore.

It is imperative that new laws that are passed at least pass the level 0
sanity test of "will the proposed law have the desired effect, will it
be enforceable, will it have unintended consequences"? All too often
the new laws fail on all three counts. The ECPA86 is a good example.
The 1992 scanner ban is another example. The Digital Telephony bill is yet
another example.

We have a couple of plectrtons which were designed to open doors, and trip air raid sirens, that are being phased with replacement of on-line (ADL) computer dispatch and relay systems. They were set up for 154.43 and triped at 910 Mhz and 2880MHZ. It's really expensisive to find parts or modify them. But if you have existing broken Plectrons and are not a wireing wiz,try swapping boards between your bad plectrons. Sometimes you can take two bad trons and get a good one.

On pagers...Motorola Minitor 2 are not for surplus sale in the firedepartments in Washingonton. You will find 2 channel (New) Shinwa's (JUNK), NEC'S, AND MINITOR 1'S (PORTABLE PLECTRONS) plentiful.

If you are still adimant about getting Minitor 2's try going to flea markets, and radio shows...I saw new portable's, minitor 2's, parts galore etc.

Best of luck and if you want get me an address and I'll send a couple of broken ones south or if we still have the station tron---will send it too.

What's cruel about it? You don't like the song? Most of the things I read in this newsgroup lean towards putting the eavesdropping prevention responsibility on the users instead of congress. Someone did something to make monitoring difficult and we call it a cruel trick on scanner enthusiasts? This is exactly what we tell people to do. Good for GE.

So let me get this straight: The California Legislature is full of "commies" because they passed a law making it illegal for the government to monitor private citizen's cordless phone conversations without a warrant or even probable cause?

Oh.

You're right, the world will be a much better place when law enforcement can listen in on everybody's conversations without a warrant. None of those nasty technicalities to get in the way like that silly, old Constitution ...

A refresher:

Amendment IV.

The right of the people to be secure in their persons, houses, papers, and effects, against unreasonable searches and seizures, shall not be violated, and no Warrants shall issue, but upon probable cause, supported by Oath or affirmation, and particularly describing the place to be searched, and the persons or things to be seized.

Unless all police depts. all choose the same digital radio system, analog communications will still be needed when one police dept. needs to radio another.

I feel that a digital transmission method must be (1) standardized and (2) defined to be "unencrypted". Otherwise the entire radio spectrum may end up being illegal to listen to (short of the broadcast bands).

I've been following to the best of my ability the information posted here about the DT bill. Can someone please clear up the confusion, as follows:

Is it, or isn't it illegal to use a scanner in combination with a computer?

Is it, or isn't it illegal to monitor frequencies which contain digital data?

Very simple questions. Are the answers as simple, though?

Design Equilibirium in Menlo Park (sorry, don't have number) sells a Guide to AR1000. It's flawed in a few places with incorrect info. but it gives you more than enough stuff to use your scanner. Sells for about $15 (over priced by a few bucks). Plenty of mail order places sell it--Grove, for example.

>{New York}

I'd love to say there is a clear cut answer to this question. It is one thing whether it is legal or not and it is another thing to ask will you be arrested/indicted if found to be doing what you ask.

The bill says it is illegal to use a scanner and or computer/software to access telecommunications services with fraudulent intent. I am no lawyer but it appears to me that this is very vague and hard to define what constitutes fraudulent intent. If you are a non paying user of the telecommunications service and you "access" it to listen, would that constitute fraudulent intent? If I were a prosecutor, I would say yes, say that you were listening for people to give out credit card numbers, so that you could go commit wholesale fraud. Certainly there are other crimes along that line that you could dream up. Of course they are not necessarily founded in fact, but that has never stopped a prosecutor.

So often the lawmakers and the courts decide that prior restraint is the best way to solve one of society's ills. A good example is the assault weapon ban. Despite that the statistics indicate you are three times more likely tro be killed by a bee sting than an assaault weapon, we now have this law on the books thanks in part, to our media helping to sell this to the American public.

In my opinion, the campaign against radio equipment is underway. The ECPA86 fired the first shot, the scanner ban of 92 pushed it further, and the DT bill takes it yet a step further.

The DT bill also prohibits intercepting (they define intercepting as extracting the message, so simply listening to encrypted stuff with no descrambling is not illegal) communications whose essential

modulation parameters have been witheld in the interest of maintaining privacy. I suppose this would apply to many things we see in common use today including digital two way radios. I understand that some police departments intend to adopt them in the future according to a posting in this forum.

An interesting sidelight is that the law specifically permits the monitoring of police and other public safety agencies, but ont eh other hand, prohibits intercepting scrambled or encrypted communications or those that have the modulation parameters witheld in the interest of security.

As you said it is a simple question, it is not a simple answer. To get any answere really worth anything, we will have to have a test case, a conviction, an appeal and then see what is the precedent

In the meantime, watch for the media to start making an issue of radio comms and security. Remember the Jimmy Carter conversation intercepted on his return flight from Haiti? Remember how an individual on this forum called the White House Communications Agency and told them that he had been listening to thier conversations? And now we have a case reported in San Jose this week where a fellow was arrested for making rip-off cellphones by pirating ESNs from the ether with a "scanner and a computer".

I suspect that the time will come when the manufacturers of scanners` will be denied type certification for scanners which cover cordless telephone frequencies. Why should they not be? After all the scanner ban of 92 denied certification for scanners capable of receiving cellphone calls, and the DT bill has now afforded the same "protection of privacy" that cellphone users enjoy to cordless phone users. (not that the law is effective).

I also would venture to say using the scanner ban of 92 as a precedent and the prohibition of possession of a scanner connected to a computer would be expected applying the same logic. That logic being: if it can be used to commit an illegal act, then we ban it. This is the logic used in the scanner ban of 92. This is the logic that will be used for banning scanners which can receive cordless.

Of course all of this is really silly. After all the Cellphone providers could have desiged a secure system: one that cannot be eavesdropped easily, and one that teh ESNs could not be pirated easily. But they chose the "ostrich in the sand approach" by ignoring a huge looming problem and then spending money tpo buy influence in Washington to "solve" the problem by further encroachments of your an my civil liberties.

Of course this is like all of the merchants refusing to buy locks for their store's doors and getting legislation passed that prevents you and me from being outdoors after dark as a means of protecting their valuables. This does not make any sense at all.

What they should do is to recognize that anyone that is transmitting
in the clear should have no reasonable expectation of security as the courts so wisely
ruled regarding cordless phones a few years back. That allowing
ESNs to float around in the ether in the clear begging someone to pirate
them is as irresponsible as printing lists of valid credit card numbers
for general distribution. The cellphone providers are the source of the
problem, they have shirked their responsibilies to take even minimal
safeguards to protect the integrity of the traffic they handle and have
shirked their fiduciary responsibility by not protecting the critical
ESNs.

In a sense they deserve to absorb the costs incurred due to piracy,
but we are all going to be the ones paying: our bills are increased to
cover their losses, and they are lobbying to take away our common
sense right to monitor anything that passes through the airwaves
(and our bodies).

It is because I think about these issues in this way that causes me
to be so down on the status quo government people making our laws
and regulations. It appears to myu limited perspective that we have
elected a bunch of fools that only want to be re-elected. I say we
deny them re-election as a reward for prostituting their positions
of power to the betterment of a limited number of mony spreading
lobbyists. It is very easy to get cynical about the government if
you take the time to really analyze the situation at face value.

I get really depressed about this unrelenting assault on our personal
liberties.

Again, folks, we have the soapbox, the ballot box and the cartridge box
here to work with. Let's use the first two so we don't have to
resort to the third.

I have another suggestion for a case for this scanner...
Go into any well stocked camera store, you can find some kind of camera
case that the scanner will fit into. A friend of mine uses a nice
little cordura (nylon) case for his cell phone. The case was made for
some kind of point and shoot camera. Cost was around $5-10... this
case is also padded. Yes I know it isn't leather!!!

You mean the APS-104 pre-selector, at only $995.00, made
with lovingly hand-wound components :-).

Indeed this will (probably) do the requisite filtering.
Unfortunately after you take the R10 (to receive the
signal and turn it into audio), and the APS-104 (to
give you narrow band filtering so you can lock onto
that transmitter), and the M3000 (to give you a digital
readout of the freq you're monitoring), you've spent
a couple thousand dollars for a device which doesn't
scan multiple stored freqs, and which is an ungainly
pile of boxes, velcro, antennas, and jumper cables :-).

Sigh...maybe one of these days I'll be able to afford
an APS-104 :-).

While I'd like to agree with you, and do for the near term, what happens when the government decides it is time to regulate Internet. It is not like they have not noticed it is here.

If it becomes illegal to do what you are suggesting, then it will have a great impact on how freely it is discussed on forums such as this, even without the inevitable regulation of the Internet.

> Richard Crisp (crisp@netcom.com) wrote:

Today's Los Angeles Times (10/19/94) had a similar article on the
front page of the paper, regarding a cellular retailer in West L.A.
cloning phones in a similar way. It was a long article, which went
into detail the whole cellular fraud problem, in which the cellular
companies in L.A. claim that 1 of 4 cell calls in this area are
fraudulently made.
Anyway, the police bust this retailer, and arrest the owner and
involved workers, but the police continue to run the store for the
whole weekend, servicing about a 100 customers who came in to have
their cellular phones reprogrammed with another fraudulent ESN, after
the one they were using was inactivated by the cellular carrier.
Apparently these dealers guarantee your cell-phone will work for 30
days after they program it with a stolen ESN. The dealers usually
charge less than $100 to do this, for one-month's of unlimted fraudulent
dialing...

The Amplified Rabbit Ears are the problem. Where are you located?
I can even pick up scrambled trunk radio with an AR1500. You can actually make
out what they are saying on Am!
I got nailed by a local AM radio station on shortwave. My outdoor antennea
now has a blocker out just for that station! So I can still listen to
Broadcast AM DX if I want.
THE SAME AM RADIO STATION COMES IN ON MY PHONE LINES I HAD TO FILTER IT OUT.

I recommend that you invest about $14 in a book called:

Guide to the AR1000

by

Howard Bornstein

It is published by Design Equilibrium, PO Box 1245, Menlo Park, Ca 94205.

It is a very complete guide to using the 1000 and is full of basics and
all kinds of little scanning tricks. You can't go wrong with it.

I think that Grove has it, however I do not have their phone or address
available.

Good luck,

Jim Finney

One of My Books that are sitting on my book shelf is entitled:
THE LASER DOPPLER TECHNIQUE
I bought it from the M.I.T. Bookstore.

I have a BSEE.

LASER DOPPLER RADAR DOES EXIST! HOW DO YOU THINK YOUR LOCAL TV STATION GETS THOSE NICE WEATHER RADAR MAPS? SOME ARE MICROWAVE BUT SOME ARE LASER DOPPLER! ALSO THE FAA IS LOOKING INTO BUILDING A WINDSHERE DETECTION DEVICE, it uses guess what ..... LASER DOPPLER RADAR. Raytheon may be awarded this project.

LASER RADAR CAN BE EASILY STEALTHED! ANY CAR CAN BE SET UP to absorb the infrared light. or use multi faceted material.

Why do I study up on this? It's my hobby. I built up a 15mw Laser for Cloud writing. It's frequenct is 520nm. Whenever I use it for either cloud writing or just playing around... someone calls in a UFO sighting. 520nm is nice because the ^&%^@# Sodium Lights don't wash it out.

Anyway the LASER Doppler RADAR bok is by Dr. Drain and is abailable in most College bookstores that offer an advanced electronic engineering course.

BTW, the light source does everything the Microwave Doppler does, except with a tigheter resolution.

Gee Som small Radar Ranges are at 10Watts.
I worked with High Speed Lasers that were capapble of 2 Gigabits per second.
The BER Monitor was a hazardous device because of the frequency it operated on!
Also one guy who liked to place the decice close to his lap has died in 91! I left
when he was diagnosed with prostate cancer. I was always carefull, I didn't even let the
the RF cable near me. I also had a shielded work area and I tried to tell
the other engineer about the hazards, he just laughed it off like yourself.
This device was only running in the 500mw range!

Well here it is, the publisher for the Laser Doppler Technique is:

John Wiley & Sons
Offices in New York , Brisbane, & Toronto
(c) 1980 John Wiley & Sons Ltd.
it sells for $59.95 hard copy
It is written by L.E. Drain
he works at the Atomic Energy Research Establishment in Harwell

FYI
Capter 1 Contents:
The Doppler Shift
Optical Beating
The Diffrential Doppler Technique

Chapter 2
Geometrical Optics
Wave Optics
Interference
The Michealson Interferometer
Interference between two reflected beams
The Farby - Perot Interferometer
Diffraction
Diffraction at Focus
Gaussian Beam Optics

Light Detectors for LDA
PhotoMultipliers (Duh)
Derivation of the Doppler Shift
Relativistic Doppler Shift
Alternative Derivation of the Doppler Shift on Scattering
Doppler Shifting by Difraction Gratings
Brownian Movement and the Doppler Shift

If you had college calculas you can understand the theory. It's not a
nontechnical book. With the information provided you can make your own
device (NO SCHEMATICS BUT ENOUGH THEORY SO IT WILL NOT BE A PROBLEM)
And do some math, what is the best frequency of light for this
device... use common sense. Infra Red causes Jitter so... please
Mr. that tells me no such thing as Laser Doppler Radar that NASA allready tested and the
Air F
Air Force allready has... tell me... what's the frequency Kenneth

MAN, I'm not just a hobbyist, It's how I earn a living. Check out the book rt tt sth

Eric B. (browere@einstein.cs.ucdavis.edu) wrote:
: I suppose the title says it all. Perhaps a kind and knowledgeable
: individual could give a more-than-basic overview of how these
: things work and how they would interface with a scanner.

A downverter essentially takes an input frequency range on
a broad basis (say the entire 800-900MHz band) and converts it
to a lower frequency range such as 400-500MHz where it can then
be received by almost any scanner. The bottom line effect is
as follows, with a downverter connected to the antenna, you
connect your scanner to the output of the downverter. Thus
if you program your scanner to receive 434MHz, you are actually
receiving (or listening to) whatever is on 834MHz.

The downverter is also sometimes called a block converter.

: A place to look for such a schematic (or if one could be provided as
: an example) would be very helpful.

Someone once said that a two part "how-to" article was run in
Radio Electronics magazine in two early issues of that publication
in 1993. I have not seen that article, however (But I'd like to
get a copy if someone has it).

You can also buy a kit or fully assembled downverter from
Ramsey Electronics (800-446-2295) for about $50 (kit) or
$90 assembled according to the Ramsey advertisement in the
August 1994 (page 77) issue of Monitoring Times magazine.

Has anyone built or bought one of the LesComm data squelches for their PRO=200x scanner? This is a device which supposedly will make your scanner bypass data, and the annoying GE beeps at the end of each transmission. LesComm sells several different variety of devices, according to the latest ad in Monitoring Times. They indicate they have information they'll send for a SASE -- but as of yet, they haven't responded to my letter :-(

Has anyone bought these products from this company?

I have always felt that it was foolish to lock out the Celular band from scanners when all the companies have to do is encode or scramble their signals. I heard the report about the bust on our local news here and my own feelings are that it serves the industry right for not protecting their equipment.

djc@crl.com Out!

Actually, now it doesn't really matter where you are, if it is an area that is under the control of United States laws. The recently passed Digital Wiretap Act included the removal of the exception for cordless phone in the ECPA. Now cordless phone falls under the same restrictions as cellular, atleast as far as the ECPA is concerned. There has been no change (yet) to prevent the manufacture of cordless-capable scanners...I guess the 103rd Congress is going to leave that up to the 104th...

And while I'm here, just a quick reminder to everyone that I am working on a FAQ on laws governing scanners. Hopefully I'll have something ready to go out in another week or two.

>guess what ..... LASER DOPPLER RADAR. Raytheon may be awarded this project.

Laser doppler radar *does* exist, and is being used by a few US police departments. (I've handled one of the units used by the Georgia State Patrol.) This is totally different from the old VASCAR time and distance equipment. However, local TV doppler weather radar is *not* laser, it's Ka band equipment manufactured by Harris. (I service this stuff.) The FAA windshear measuring radar is also *not* laser. It's UHF RF at 449.0 MHz (right in the amateur 70 cm band's repeater input segment, not pretty).

The laser speed measuring doppler radar unit I handled has a TV camera sensitive to the IR frequency used by the laser unit as an aiming device. You can clearly see the spot reflected off the car in the viewfinder. The unit is setup so the officer can videotape the bust. The speed reads out in characters keyed into the video picture. If you try to stealth the car, it's obvious in the camera viewfinder, and all the officer has to do is move the point of aim slightly, to a piece of chrome, the windshield, a headlight, a parking light reflector, etc until he sees the spot reflection, then he's got you.

The only way I can see to beat this system is an active IR jammer. It'd have to be really powerful too because even a functioning headlight, which pumps out lots of IR, won't blind the system.

Gary

I was not aware that any of the current statutes prohibited someone from
demodulating digital signals. I thought it only prohibited individuals from
decrypting encrypted signals.

4146. Air Force Dogfights over Central PA!

Newsgroup: rec.radio.scanner
Date: 1994-10-20 15:36:28 UTC
From: mclin@bucknell.edu
Message-ID: <mclin-2010941136190001@maci54.bucknell.edu>
Source record: 266925

Recently, I traded in my Pro-51 scanner for an upgrade to the Pro-43 mainly to tune in to the 225-400MHz military band. I live about an hour north of Harrisburg, PA, and about 150 miles from the nearest military installation in Willow Grove, PA, so I never really expected to hear anything more than an occasional aircraft (or space shuttle) passing through our airspace. However, last night I was pleasantly surprised to learn there's more activity than I thought there would be here.

As I was searching across the band last night (using a 1/4 wave ground plane antenna 15 feet above our house) my Pro-43 unexpectedly stopped on 301.6MHz with a strong signal. I immediately hit the monitor button and listened to the action unfold. Apparently, there were three fighter aircraft (type unknown) in our airspace last night conducting dogfight simulations. They identified themselves as Bromo One, Bromo Two, and (that's right) Bromo Three. A fourth voice was also heard, and this person would instruct the pilots during these drills. For instance, he would instruct Bromo Three to leave a designated air space, and he would then instruct Bromo One to act as a target aircraft at 17K feet on a defined heading while Bromo Two would pursue this aircraft and attempt a "kill." Once all the instructions were given out and the drills got underway, radio silence was maintained, and I assume the whole thing was watched by radar. Then an announcement would be made: "that's a kill." Pretty interesting stuff. Heard about a half-hour's worth before they decided to call it a day and cleared a flight corridor to Harrisburg, then back to Andrews AFB. BTW, at one point they lost radio contact with Bromo Three, so they switched to 259.4MHz and resumed the action.

The Diode is still "Piggy Backed" for this fix...I assume that
when the initial batch of boards have been used they will implement the
fix rather more neatly than the current method..(then again maybe
not..)

> There was also a bug in the Audio Scan feature that AOR said they would be
> fixing (this may be the squelch threshold problem you referred to).

In the latest shipments three Surface Mount components have had
their value changed, playing around with the values seems to make slight
difference as to how Audio Scan responds, different values may
work better for some perople rather than others depending upon
cirumstances.

I posted a request a couple of weeks ago as follows:

>I will be visiting Orlando, Baltimore, and Louisville later this month
>and am seeking frequency lists for those cities. I have plenty of
>Disney World frequencies so no need to include them in the lists.

I got 4 responses with Louisville frequencies. However, *NO ONE*
responded with any Baltimore or Orlando frequencies! (Perhaps there
are no scanner enthusiasts from these cities who have internet access
and monitor this group!)

I am leaving for this trip soon and still need Baltimore and Orlando
frequencies. If you have any please email them to directly to
plocke@irvine.com.

Thanks,
plocke

I am looking for a brief list of frequencies for the Metropolitan Toronto area. Some of the frequencies I'm looking for include Metro emergency services (fire, ambulance, police), Ryerson Polytechnic University frequencies, and any others which you may happen to know of. Any responses and information regarding this would be appreciated. Preferably send your responses via email to rbenner@acs.ryerson.ca.

Thanks in advance,
Ross Benner

: : happen to have a few other scanners around ;-)

Your could make a 1/4 wave shorted stub out of coax - calculate a quarter wavelength of the freq you want to null out _in the coax_ (that is, take the velocity factor into account). attach one end across your antenna's coax, and short the other end shield to center conductor. Voila! A nifty, cheap notch filter!

The other thing people have tried is to use a moving reflector.
Doppler systems depend on getting a lock on the frequency difference
between the forward and reflected beam. (you can't directly
count the waves in optical or near optical systems (at least
not recently)). So if you add a strong more or less random
component to the reflected beam you make the lock harder to get.
One of the engineers involved in inverse scattering was having
his students design such reflectors - because the wave length
is small they don't have to be much bigger than say fuzz dice ;-).

4161. Re: Scanners vs. Shortwave

Newsgroup: rec.radio.scanner
Date: 1994-10-20 23:10:50 UTC
From: rouse@mayo.edu
Message-ID: <386n6g$adm@fermat.mayo.edu>
Source record: 266683

Scanners are radios that are capable of storing at least 10 (I'm not sure of the exact number specified by law) frequencies and searching these frequencies for radio transmissions, stopping the search when radio traffic is detected and recieving this traffic. The exact frequencies scanned make no difference. The idea is to have a scanner capable of 50 -100 (however many you need), program in the frequencys of the local police, fire, sheriffs Depts and listen to the action. These radios may be capable of recieving cellular phone traffic, cordless phone traffic and other communications modes often thought to be secure, listening to some of these is illegal. Shortwave radio is rather vague in my mind, it is radio traffic in the 3.0 - 30 Mhz range. There are many international broadcasts in this range, also many amateur radio transmissions in this range. One of the reasons this frequency range is used is because the radio waves may bounce off of the ionosphere layer of the atmosphere and skip back to earth at some distant point to be received clearly. Shortwave radios usually must be manually tuned, but they may scan in the designated frequency range and a scanner may be capable of scanning shortwave frequencies.
Clear as mud, Sorry.

There's also the question if one police department goes digital, how in the heck will other police and fire depts hear it too? In L.A. County, you have zillions of police departments for different cities, and they do have to talk to one another often, for example, as criminals are trying to getaway and drive all over the place. Also, other agencies, and even some private agencies, do have a legitimate need to listen to this stuff, and sometimes transmit too. There will have to be some standardizing, which all communities can connect too. Otherwise, patrol cars would be weighed down with a 1,000 pounds of radio gear, trying to listen to all these different inter-agency transmissions. The costs would be enormous.
...just my thoughts.

Yep. Try the 869 - 894 mhz range. NBFM in 30 khz steps, if possible.
Just don't tell no one, though. It's supposed to be illegal in the States.
Guess it's about time to post my listening spectrum list again.

4167. THE RADIO SPECTRUM

Newsgroup: rec.radio.scanner
Date: 1994-10-20 23:55:49 UTC
From: g9153402@huey.csun.edu
Message-ID: <387025$mtc@nic-nac.CSU.net>
Source record: 266954

THE RADIO SPECTRUM

This is an approximate look, to help in searching frequencies on a scanner or shortwave radio. Just be aware, having the right frequency may not be enough, in tuning to a certain frequency. The time of day, atmospheric conditions, location, mode you're in (AM, SSB, Narrowband FM, Wideband FM, etc.), and your equipment, are also equally important. You'll find most transmissions are broadcasted in Narrow-band FM. Some main exceptions are shortwave (AM & SSB), commercial AM radio (AM), commercial FM radio (Wideband FM), television (Wideband FM), citizens band radio (AM & SSB), aeronautical communications (mostly AM), and some military VHF/UHF (Wideband FM). Most all scanners will pick a default mode for you, depending on what frequency band you are in. But many scanners also let you manually switch between modes (AM, FM, etc.) and frequency search spacing (5 khz, 12.5 khz, etc.) if the default modes are not correct. Happy Listening!!!

FREQUENCY USES/SERVICES
(in Megahertz unless
otherwise indicated)
---

10 - 150 khz Military/government, submarine
(.01 - .15 MHz) communications.

150 - 535 khz Longwave Band, beacons, foreign broadcasts,
(.15 - .535 MHz) maritime.

535 - 1700 khz Your standard AM radio dial.
(.535 - 1.7 MHz)

1.7 - 30 Shortwave/High Frequency Band. Broadcasting,
two-way government, military and commercial
communications, amateur radio, CB radio (approx.
27 MHz), others.
Shortwave - Approx. Range Meter Band
1.8 - 2.0 160*
2.3 - 2.495 120
3.2 - 3.4 90
3.5 - 4.0 80*
3.9 - 4.0 75
4.75 - 5.06 60
5.9 - 6.2 49
7.0 - 7.3 40*
7.1 - 7.35 41

9.4 - 9.9 31
10.1 - 10.15 30*
11.6 - 12.1 25
13.57 - 13.87 22
14.0 - 14.35 20*
15.1 - 15.8 19
18.068 - 18.168 17*
17.48 - 17.9 16
18.9 - 19.02 15
21.0 - 21.45 15*
21.45 - 21.75 13
24.89 - 24.99 12*
25.6 - 26.1 11
28.0 - 29.7 10*
(In general, the lower shortwave frequencies
<higher meter band> are received better during
the night, while higher frequencies are re-
ceived better during the day. There are also
some amateur radio bands between many of these
shortwave bands(*). Consult a shortwave guide
for more detailed information.)

30 - 50 Very High Frequency Band. Government, business,
walkie-talkies. Also, cordless phones and
'baby monitors' found about 46 - 49 MHz.

50 - 54 Amateur radio 6 meter band.

54 - 72 TV Channels 2-4.
Channel 2 Audio (Wideband FM) 59.75
Channel 3 Audio (Wideband FM) 65.75
Channel 4 Audio (Wideband FM) 71.75

72 - 76 Manufacturing, remote control, eavesdropping
bugs, etc.

76 - 88 TV Channels 5-6.
Channel 5 Audio (Wideband FM) 81.75
Channel 6 Audio (Wideband FM) 87.75

88 - 108 Your standard FM radio dial.

108 - 136 Aeronautical communications (AM).

136 - 138 Satellites.

138 - 144 Military communications.

144 - 148 Amateur radio 2 meter band.

148 - 150.8 Military use.

150.8 - 174 Business, highway, law enforcement, government,
weather, maritime.

174 - 216 TV Channels 7-13.
Channel 7 Audio (Wideband FM) 179.75
Channel 8 Audio (Wideband FM) 185.75
Channel 9 Audio (Wideband FM) 191.75
Channel 10 Audio (Wideband FM) 197.75
Channel 11 Audio (Wideband FM) 203.75
Channel 12 Audio (Wideband FM) 209.75
Channel 13 Audio (Wideband FM) 215.75

216 - 220 Maritime and aeronautical.

220 - 222 Land mobile communications.

222 - 225 Amateur radio.

225 - 400 Military aviation and space.

400 - 406 Military and government.

406 - 420 U.S. Government.

420 - 450 Amateur radio.

450 - 470 Ultra High Frequency Band. Business, industry, military, fire, government.

470 - 512 TV Channels 14-20, shared with law enforcement.

512 - 824 TV Channels 21-69, others.

824 - 849 Cellular telephones (receivers/handsets).

849 - 851 Aeronautical telephones (ground-based towers).

851 - 866 Business, public safety, trunked systems.

866 - 869 Public safety, law enforcement, trunked systems.

869 - 894 Cellular telephones (towers).
Note: Even though listening to cellular telephone calls is technically illegal in the United States, one will usually do better listening to calls on the tower frequencies, as opposed to the handset frequencies. This is because most cellular phones transmit less than one-watt of output. So unless the cellular phone is very close to you, you will have much more luck scanning the more powerful towers, which transmit/receive for each cell site.

894 - 896 Aeronautical telephones (handsets).
Note: In scanning airplane telephones, you will usually do better listening to the handset frequencies, instead of the tower frequencies, unless you are very near a ground transmitter.

But, in any event, call traffic heard on handset frequencies (which are transmitted from a high-powered transmitter on the aircraft) you may hear nothing at all, or many conversations, depending on your location and time of day.

896 - 901 Private land mobil units.

902 - 928 Land mobile, amateur radio, personal communication units, cordless telephones.

928 - 932 Radio paging.

935 - 940 Business radio.

941 - 944 Government and non-government fixed services.

944 - 952 Broadcasters' studio-to-transmitter links.

952 - 960 Private fixed services, paging.

960 - 1240 Aeronautical navigation.

1240 - 1300 Amateur radio.

1300 - 1350 Aeronautical navigation.

1350 - 1400 Radio location.

1400 - 1427 Radio astronomy.

1427 - 1429 Point-to-point, mobile, space.

1429 - 1660.5 Various satellite transmission uses.

1660.5 - 1668.4 Radio astronomy.

1668.4 - 1700 Meteorological aids.

1700 - 1850 Meteorological satellites, U.S. Government.

1850 - 1990 Fixed point-to-point, microwave.

1990 - 2110 Broadcast studio-to-transmitter links.

(end)

Source record: 266646

I am going to be in Chicago next week and thought I would take my scanner with me but I am unsure of what treatment I will receive from U.S. and Canadian customs. My Pro-43 hasn't been modded (yet) so it can't receive cellular.

Are there any Canadians or Americans out there that have travelled across the border with their scanner and experienced any problems? As long as I have my original purchase receipt will I be O.K? Hope there's someone out there that can enlighten me.

I would also appreciate it if someone could send me the police, fire, ambulance etc. freq.'s used in Chicago.

Thanks in advance.

Paul.

4175. Pro-46 t-pad mod (Retry)

Newsgroup: rec.radio.scanner
Date: 1994-10-21 02:19:34 UTC
From: dbarton@unix.cc.emory.edu
Message-ID: <3878fm$fe7@emoryu1.cc.emory.edu>
Source record: 266649

Greetings. Since there have been some requests lately I thought I would repost this spiffy mod for the Pro-46. This will not restore full 800 MHz coverage, but it will restore the hole b/t 868.9375, and 896.1125 with straight 30 kHz steps. All standard disclaimers apply, including but not limited to the following:

It is not legal to listen to other people's telephone conversations with radio and/or scanner equipment. This modification is provided for information purposes only, not as an attempt to encourage people to commit illegal acts. No warranty is offered, or should be implied.

PRO-46 TOUCHPAD MOD

This mod will give you access to several frequencies not in the Pro-46's normal scanning range. It will require you to erase all currently entered frequencies, so I suggest that you write them down on paper *before* you begin this process.

1. Turn off the power.
2. While holding down the 2, 9, and L/Out keys, turn the power back on.

This will erase the currently entered frequencies, and input freq.s into the first 25 memories. Of particular interest are the freq.s in the following memories:

#14: 66.450
#15: 76.825
#16: 87.425
#23: 888.96

Each of these freq.s is outside of the normal scanning range of the unit. #14 and #16 are in the TV range, #15 is in the land mobile range, and #23 is in the cellular range.

To use any of these freq.s, first store them in a monitor memory,* then once you have reprogrammed your scanner you can place them into a regular memory. You can then use the manual scan feature to search through the ranges these frequencies give you access to. You still cannot enter frequencies in these ranges manually, but any freq. stored in a monitor memory can be transferred to a regular memory. Best of luck.

*To place into a monitor memory, open the squelch all the way (so you hear static) and push one of the arrow keys. This will start the manual scan feature, but the frequency should not change because the squelch is open. You can then press the Monitor button to store the freq.

Permission is hereby granted to copy, transmit, archive, or send this file by any medium as long as it is reproduced in its entirety. Many thanks to those who submitted the info originally (sorry I lost the names).

4178. 2006 mod question

Newsgroup: rec.radio.scanner
Date: 1994-10-21 02:36:25 UTC
From: dbarton@unix.cc.emory.edu
Message-ID: <3879f9$fe7@emoryu1.cc.emory.edu>
Source record: 266957

Just received my spiffy new 2006 from Marymac, and wanted to confirm something I thought sure I had saved. I know that clipping D502 (the lower diode when looking down into the case right?) restores full coverage of the 800 MHz band, but I think I remember that clipping the upper diode increases scanning speed. Is this true? How much faster does it go? Is there any possibility of damage to the unit at the faster speed? Why would they put in a diode to slow the thing down? Enquiring minds want to know!

I looked at several ftp sites, and found no mention of the speed enhancing mod, so someone with the knowledge and expertise might want to send it in.

One more question, what is in the range of 824-851 MHz anyway, and will this mod restore it in the 2006?

Thanks in advance for any help...

Doug

Here it is....
Modification of PRO-46 for full 800 Mhz coverage with 30 Khz stepping
available.

1. Remove the battery pack, battery door and antenna.
2. Remove the four black screws from the back of the radio, then
push upward on the bottom of the rear of the case, carefully
swinging it upward and removing it.
3. Carefully insert a small screwdriver between the two boards
next to the interconnect plug in the lower right corner. Gently
pry the top board up to separate it and set it aside.
4. Unsolder the copper-coated plastic shield from the microprocessor
and set it aside. ** CAUTION!! Too much heat will damage the
shield. **
5. Locate the two chip jumpers imprinted with "0". Carefully unsolder
and remove both.
6. Solder one chip jumper across the two upper most unused solder
pads. (Soldering a jumper across the lower two pads changes the
30-50 Mhz band to 68-88 Mhz.)
7. Reverse steps 1-4. The modification is completed.

4182. FBI director says they may pursue outlawing non snoopable crypto!

Newsgroup: rec.radio.scanner
Date: 1994-10-21 04:49:05 UTC
From: crisp@netcom.com
Message-ID: <crispCy0Apt.JwL@netcom.com>
Source record: 266749
Cross-posted to: rec.radio.shortwave,rec.radio.scanner,alt.radio.scanner

We all knew it was coming, here it is:

Washington, DC -- If private encryption schemes interfere with the FBI's ability to wiretap, they could be outlawed, according to recent comments made by the agency's Director Louis Freeh.

Freeh told attendees here at the recent conference on Global Cryptography that if the Administration's Escrowed Encryption System, otherwise known as the Clipper Chip, failed to gain acceptance, giving way to private encryption technologies, he would have no choice but to press Congress to pass legislation that provided law enforcement access to *all* encrypted communications.

If, after having pushed Digital Telephony through Congress (which hadn't yet happened when Freeh spoke at this conference), all the Bureau ended up with during wiretaps were the scratchy hiss of digital one's and zeros being hurled back and forth, Freeh made it clear that he would seek a congressional mandate to solve the problem.

In other words: Roll your own coded communications; go to jail.

Freeh's comments, made during a question and answer session at the conference, are the first public statements made by an Administration official hinting at a future governmental policy that could result in the banning of non-governmental, unbreakable encryption methods.

Freeh's remarks were first reported on the WELL by MacWorld writer and author Steven Levy. The FBI confirmed those statements to Dispatch.

The Administration, however, continues to state that it has no plans to outlaw or place any restrictions on private encryption methods.

A White House official said there are "absolutely no plans" on the table to regulate domestic encryption "at the present time." He wouldn't comment, however, as to whether the Administration would back an FBI attempt for such legislation. "Freeh doesn't seem to need a lot of White House support," to get things done, the official said.

FBI sources said any moves to approach Congress about regulating private encryption are "so far out there" time wise, that the subject "doesn't merit much ink," as one FBI source put it. "We've got to make sure the telcos rig up their current networks according to the new [digital wiretap] law before we go worrying about private encryption stuff," he said.

An FBI spokesman confirmed Freeh's position that the Bureau would aggressively seek to maintain what the spokesman called "law and order objectives." If that meant getting laws passed so that the Bureau's "authorized wiretap activities" couldn't be thwarted by "criminal elements using non-governmental" encryption schemes, "then that's what he [Freeh] would do," the spokesman said.

When the Administration went public with its Clipper Chip policy, it stressed that the program would be mandatory. Many civil liberties groups wondered out loud how long it would be before private encryption was banned altogether. The White House, anxious for the public to buy into its one-trick pony the Clipper Chip, said that wouldn't happen.

But the Administration hedged its bet.

Buried in the background briefing papers of the original Clipper announcement, is a statement that the White House doesn't consider the public's right to use private encryption methods are protected anywhere in the Constitution.

4185. Pro-43 Mods

Newsgroup: rec.radio.scanner
Date: 1994-10-21 08:22:41 UTC
From: streeter@nbnet.nb.ca
Message-ID: <streeter.12.0008610F@nbnet.nb.ca>
Source record: 266973

This file is meant to replace the old PRO-43 mod file. 17.12.92
==========
From: armille@afterlife.ncsc.mil (A. Ray Miller)
Summary: cellular (870-890 MHz) and low band (51-88 MHz) restoration for PRO-43

A few people have mentioned the cellular mod for the PRO-43; it turns out you should not remove but MOVE the diode. Doing so allows cellular coverage as well as low band (up to 88 MHz) coverage.

PRO-43
Cellular Frequency Restoration and Low Band Expansion

The following procedure requires familiarity with microcircuit soldering and will violate your warranty. Grove Enterprises assumes no liability resulting from its attempt, nor will accept the modified scanner for return under any condition.

TOOLS NEEDED: Fine point, low power soldering pencil; solder wick or a desoldering tool; pointed awl, hemostats or pointed tweezers; small Philips screwdriver; solder.

1) Remove the battery, antenna and back cover (held in place by four screws).

2) Remove the six screws holding the top circuit board in place. Carefully unsolder the two antenna connections from the board. Bend the antenna ground tab fully up from the board. Carefully lift the board, unplugging the black connector at its base, and lay the board out of the way on its bundle of colored wires.

3) Remove the two screws from the next board and lift it, carefully unplugging the white connector at the bottom of the board. Lift it up and lay it aside on its brown wire (which can be unplugged if necessary).

4) Unsolder and remove the metal shield from the final board, revealing the microprocessor; note the row of diodes labeled D1-D5 above it. Only diodes D1, D2, and D4 are present; assisted by a pointed tool, unsolder and remove D4, the lone diode (this restores cellular frequencies which will be searched in 30 kHz steps).

5) Resolder the removed diode carefully into position D3 to extend low band coverage to 88 MHz.

6) Reassemble the boards, paying particular attention to the alignment of the plugs. Test the radio by entering any frequency between 870 and 890 MHz (cellular) and 51-88 MHz (low band).

In my area, all the fire pull boxes have an antenna like "thing"
protruding from the top of every box. It always made me curious, yet two
seconds later I'd forget all about it.

Then it donned on me that every time a dispatcher sends the trucks
rollin' for a box alarm, they always say "radio box alarm".

Hmmm...

Does anyone know which freq. range this might be in ??

I imagine the only thing you might hear is a sequenced no. of tones
indicating which box is activated but I still have that yearn to know more...

I just need to know what is ...

Thanks

Cellular. More specifically, the handset to the tower. You'll be able to
hear one way conversatons here, tho its illegal

That's a pretty broad area of stuff. My best reccomendation would be
Police Call and/or Beyond Police Call.

Baltimore City Police are in the 453-454 ish range. Baltimore _County_
Police use an 800 mHz trunked system. City fire depts are 154-154 ish range.

Hope this helps.

Hi. I have an AOR 1500. I have several questions. In the USA are there frequencies which are "missing" on the AOR 1500? Mine has all it's brains there, I'm curious about what they sell in the US.

Next, is there some "trick" which will allow me to clear all the programmed channels on the AOR1500? It's pretty tedious if you decide to re-arrange everything and want to clear everything.

Lastly, along the lines of the previous question, are there any undocumented key combos that I might be interested in?

Thanks. Oh, one last comment, this is one of the most useful newsgroups I have encountered so far!!

>

My service manual is away with a friend at the moment but from my
scribble notes......

Remove the front panel from the radio and gain access to the
logic board which is behind the LCD display etc. You need to
locate pads A7 & V3.

I can't remember if the pads are labeled, if not you will need
the service manual (obtainable from Icom) and locate pads A7 & V3.
These are (were ?) unused ! Use a short jumper from the right
hand side of A7 to the right hand side of V3.

Thats it - continious coverage on the Japanese versions.

I have not seen the "inside" of the Japanese one for some time -
things may have changed by now !

The only problem I have with my HTX is that I can't, while using my Icom EM-46 mic, have just the microphone plugged in. This would allow me to hear incoming over the bigger, louder speaker, yet not have to pick up the radio to transmit.

I figure the only way out of this will be to build myself a little patch cable.

Richard (et al.)

Pray tell, what is it that you are doing that

a) You need to encrypt your transmission and

b) You don't want the government to find out what you're sending.

Perhaps you should rethink your angle on this. If you had a blanket covering a bunch of "stuff" in the back seat of your car, wouldn't you expect the local authorities to become suspicious? What if you didn't allow them to look underneath, even with a warrant?

Please don't get me wrong - I don't particularly like the idea of any "backdoor" on encryption. In fact, if the legislation comes up to outlaw private encryption, I'll be calling my rep on the hill to voice my opposition. All this just makes you sound very suspicious...

The cellular radio mobile transmit range is 824 to 849 MHz. The cellular base stations transmit from 869 to 894 MHz. A few years ago, it became illegal to sell scanners that cover these ranges. More recently, it became illegal to sell scanners that are *easily modifyable* to cover these ranges.

I don't know whether it is legal or not to sell frequency block converters that would simply move these bands to where scanners could pick them up. Does anyone know?

> 1. Does the law refer to mobile scanners and therefore exempt handhelds?

The last few weeks I have been working on a FAQ covering scanner laws.
According to everything I have assembled, all of the states that ban scanners
in cars exempt licensed hams from that law (provided you're not using your
scanner to facilitate another crime). There may, however, still be local city
and county ordinances that may cause you some problems.

> 2. I believe that my FCC ham license exempts me from the law regarding
> using a scanner in a vehicle. Am I correct?

No. The FCC ruling only covers using ham tranceivers that also, by design,
receive other out of band frequencies. It does NOT give you blanket permission
to install a PRO-2006 in a car. And before anyone asks, or claims, no, the
FCC does not consider a HT attached to a scanner with tape to be a transceiver.

And, as usual, please consider this my usual disclaimer that I am not an
attorney and none of this should be taken as legal advise, etc etc etc. One of
these days I'll get around to putting this into the .sig file...

No, these systems do not automatically transmit warnings. That's
a different short range system used on airport property. These
big honkers run megawatts ERP firing straight up from "rural"
sites. They are used to do atmospheric profiles looking for
conditions that promote windshear.

4199. Question on Freq downcoverters

Newsgroup: rec.radio.scanner
Date: 1994-10-21 14:03:24 UTC
From: tbohr1@ed8751.pto.ford.com
Message-ID: <388hnc$cj8@ef2007.efhd.ford.com>
Source record: 266766

Hello all:

I've heard of freq downconverters (especially for 800 Mhz cellular down to 400 Mhz). My question is:

Knowing the step size is 30 Khz in the cellular range, does the freq converter somehow maintain this in the 400 Mhz range? My suspicion is NO, and that at best you'd get only a fraction of the full range in 400 Mhz (like getting images + or - 21.xx Mhz away from 869-896). Anyone have any real experience w/ this?

Thanks
Tim

: : : radiated power would be about 10 watts - at the mouth of the horn.
: :
: : This isn't right. The mouth of the horn is too close for the
: : gain to fully develop--you are still in the near field region.
: : Otherwise, you could run into the paradox of two horn antennas
: : being close together, and getting more energy out of the
: : antennas than you put in.

: The point was, that would be the erp. The actual power is still
: 100 mw. Whether the erp is developed at the mouth of the horn, or
: 500 feet away is immaterial to the argument.

True, the ERP isn't relevant. But quoting it make peoples think
that it is. And getting the theory wrong only adds to the confusion.

What is material is the field strength, in power/area.

If you have 100 mW going through a little waveguide, perhaps only
2 cm^2 in area, you have a whopping 50 mW/cm^2. Now, if you
spread out the enery with a 10 x 10 cm horn, it drops to roughly
1 mW/cm^2. And if spread it out over a really big dish....

True, the energy density isn't uniform, but I think this
is close enough for people to understand why little antennas
can be more dangerous than those huge dishes, at least
in terms of radiation hazards.

This is so stupid and short sighted! Let's see here...
The FBI suspects major illegal stuff going on so they tap their comms.
Ooops, they are crypto!
So, Mr. FBI agent knocks on their door and says, "I can't tap your lines,
could you please stop encrypting your communications? If not I'll have to
arrest you."
Either way they have blown their case for the major crimes.

So how is this law ever going to be used?

Good sensitivity. Picks up 100KHz to 1.65GHz Scans 30 CPS. Has 1000
memories. Real nice radio. The only thing I hate about it is that it
has a mandatory 2 second minimum delay before scan resumes. This
absolutely sucks for scanning 800MHz trunked stuff. Also, if you're
into the 800 MHz cell band, you;ll have to use 10 KHz steps (no option
for 30 KHz steps). This, along with the slow scan rate really makes
for slow scanning through the cell band. I've noticed images 455MHz up
from the actual locations in the UHF band.

I just took my old AR 1000 and found the frequency extention mod on
Cserve that extendes the range down from 8 MHZ to 500 Khz and allows
scanning from 500 Khz to 1.3 Ghz with no gaps. Takes care of that
600-700mhz gap that you could manually step thru but not scan too.

Its great!
Essentialy this mod turns an AR 1000 into an AR 1000xlt with NO GAPS in
the frequency range..
Looking for a computer interface mod if one exists...

>others? Thanks, guys... Don KE4PLP

You want the booklet entitled "NOAA Weather Radio - The Voice
of the National Weather Service."

Although the booklet is a few years old, it lists stations on 7 freqs:
162.55, 162.4, 162.475, 162.425, 162.45, 162.5, and 162.525 MHz.

The following markings appear on the back of my pamphlet:

NOAA/PA 76015
Rev. July 1988
US GPO:1990 0 -254-066

The pamphlet says a listing of NOAA Weather Radio receiver
manufacturers is available by writing to National Weather
Service (Attn: W/OM11), National Oceanic and Atmospheric Administration,
Silver Spring, MD 20910. Perhaps you can obtain more pamphlets
from that address, too.

These are federal radio stations, not licensed by the FCC.

> Does anyone know which freq. range this might be in ??

Suggestion: get a frequency counter, put it CLOSE to the alleged antenna and then pull the fire alarm. Get the frequency... and then leave quickly. :-)

Some apartment buildings where I live now put "invisible dye" on pull stations now, "invisible" meaning visible only under ultraviolet light. Guess they got tired of "invisible" fires. So you may want to wear gloves. :-)

I tried posting this in alt.radio.scanner a couple of times but had no responses. I have an *old* Bearcat 210 (not a 210XL) ten channel scanner that I'd like to do some work on. If there are some frequency extension mods I'd like to hear about them but what I'd really like to do is install a signal strength meter.

I've played around with the design of HF antennas in the past and have thought about designing something that would work with my scanner. It's pretty difficult to tune an antenna though if you can't measure signal strength. I'm also considering building a directional antenna so a measure of signal strength is important in that regard as well.

So, can anyone help me out? At the very least, I'd be interested in getting a schematic for this radio.

Thanks,

Ok,if no one going to give Paul a little sympathy, I guess I will.

Paul: if that really happened, give 'em as much hell as you can muster.
Go as high above the salesman's head as possible. Radio Shark has
a habit of trying to nickle and dime people. If they can get rid of
a display unit or a defective unit by telling the customer that it's the
only one in stock or neglecting to tell the customer that the unit had
been brought back. As a rule, I regard all those weasles with suspicion.
The only ones I actually listen to are the ones that I have had prior
experience with, and blow off the rest. I swear I have never seen a
national chain have such consistently untrustworthy salesmen as
Radio Shark (yes, I have lived in other states MS,TX,GA) and the song
remains the same. They seem to be trained in sales rather that
electrical theory or signal propagation or ANYTHING RELEVENT TO WHAT
WE GO IN THERE FOR....

I buy resistors and other small components from them because it's convenient
and I know EXACTLY what i'm paying for.Thank God for that, because I had
a salesman SWEAR to me that the little "m" as on a "500mA wall adaptor"
meant "MEGA". That's a difference that could cause some problems.

: I've been following to the best of my ability the information posted here
: about the DT bill. Can someone please clear up the confusion, as follows:

: Is it, or isn't it illegal to use a scanner in combination with a computer?

Simple answer (sometimes) as it depends on exactly what you
are doing. The mere interconnecting or
interfacing of a computer to a scanner is not illegal.

: Is it, or isn't it illegal to monitor frequencies which contain digital
: data?

Again, only sometimes, depending on what the data represents.
If the "data" is digital speech on a cellular call, it is
illegal, other data monitoring (weather satellite data, etc.)
is certainly legal.

: Very simple questions. Are the answers as simple, though?

But alas, the simple questions often have the most complex
answers because it just isn't as simple as it seems :-)

Marty I work for a large corporation and drive a tractor trailer. I am also a ham. I have found that in all cases it is easier and more effective in the long run to carry a good handheld scanner, an external power supply plug, and a good external amplified speaker then to take and mount a 2006 in a auto or truck. The best unit I had for this was an AOR 1000 which had several nice features including a light that stayed on all the time if set right. I currently use a Pro43 which works but isn't all that great compared to the 1000 but it is still better then others.

I came to this conclusion after I lost over a $1000 worthg of ham gear from a car to a midnight thief who walked thru my neighborhood a couple of years ago.

Times are changing. It may be something to consider.

Review: TUNING IN TO R.F. SCANNING - from polic to satellite bands
Author: Bob Kay - TAB Books Division of McGraw-Hill Inc. 1994
ISBN: 0-07-033964-3 $14.95

This short book (150 pages) is an excellent guide for beginners to the fascinating world of scanner radio monitoring. It is well written in an informative style and addresses the main questions and issues of concern to someone with little or no knowledge of the subject.

The first chapter is devoted to information and advice on selecting the proper scanner to suit the listener's needs. Authou Kay explains the terminology and what the various specifications mean in everyday language. In addition, he covers the different controls, functions and features of today's popular scanning radios. The second chapter covers the different types of antennas, installation and most important, advice and warnings on the subject of lightning. Chapter three deals with coaxial cable and connectors.

The book changes focus with the fourth chapter which is entitled Rules and Guidelines, and covers subjects like the radio spectrum, frequency spacing, false frequencies such as birdies and images, simplex/duplex transmissions, repeaters, narrow and wide-band and the differences between AM and FM. Chapter five is devoted to scanning legalties, including the Electronic Communications Protection Act of 1986 and state laws that govern scanning radios.

The final chapters covers popular monitoring targets such as amateur radio, baby monitors, business communications, news media, railroad, fast food (no kidding!), aircraft, cordless microphones and telephones, fire, Medivac, military, ship-to-shore, police and Federal law enforcement, outer space and sports teams. There's even a section on monitoring the President. The chapter on frequency listings contains a wealth of frequencies for the novice to explore, and tips and advice on how to search. There's a section on computers and scanning, clubs and magazines with a detailed listing of addresses and contacts. The book concludes with a question and answer section and an index.

I was impressed by the amount of good information packed into 150 pages and would not hesitate to recommend this book to anyone who has become interested in monitoring the VHF and UHF radio spectrum or has just received or purchased a scanning radio. I only wish TUNING IN TO R.F. SCANNING had been available when I first became interested in scanners It would have saved me a lot of time.

>end up being illegal to listen to (short of the broadcast bands).

There is a standard called APCO-25 That defines voice/digital voice and data communications used by Law enforcement agencies. And for instance, Motorola's ASTRO radio system has a "non-encrypted digital mode" It is still digital, but is not considered "coded / scrambled". And yes DSP based decoders will most definately be the future of scanning as will the computer.

GEnie fired off this press release today:

CQ, POPULAR COMMUNICATIONS, GO ONLINE WITH GEnie

CQ Communications, Inc., one of the largest publishers of radio & electronics related magazines, books and videos, will be available for product support on GEnie, the online service from General Electric Information Services, Inc . The announcement was made by Glen Johnson, manager of GEnie's Radio & Electronics RoundTable .

GEnie subscribers will be able to access product information, subscribe to magazines, and communicate directly with CQ's staff online. "We welcome CQ to the Radio RoundTable; we feel their presence on GEnie will be a tremendous benefit to CQ's readership and GEnie members alike" said Johnson .

CQ Communications publishes five magazines; CQ - The Radio Amateur's Journal, Popular Communications, Communications Quarterly, Microcomputer Journal, and Electronic Servicing and Technology, each of which will be represented on the Radio & Electronics RoundTable . CQ's magazines boast a total circulation of over 200,000 .

Johnson says that CQ will have a support area within the Radio & Electronics RoundTable, which is expected to be available to GEnie users by early November.

For more information, write to radio.rt@genie.geis.com .

You'll find the PLL loses lock somewhere about 670 MHz. Try tuning UHF
television audio and some of the signals that should be there are not :-(

Still, it's =almost= without gaps, and you do get quite a bit extra for
"free".

[rest deleted]

I think -you- have the wrong angle, here. What business does the government have prying into our private dealings? The only reason that government wants to be able to listen to private conversations is so that they can, um, listen in on private conversations. There's a sort of Murphy's law involved here: Whatever government -can- abuse -will- be abused eventually. Is this something we want abused? Government officials listening in to criminals sounds like a good thing to many, perhaps most, people. However, what happens when the criminals are the ones in government office? Like now, for instance? Rostenkowski (18 years in office, 17 indictments) Byrd (admitted to providing young males for homosexual prostitution OUT OF HIS OFFICE). The list could go on, but you get the idea.

I forget who said it (Franklin?) "Whatever gov't does, it does -deliberately-" (or was the word "intentionally"?).

All of the older Bearcat scanners were manufctured by Electra Inc.,
who sold out the Bearcat scanner line to Uniden in the mid 80's.
At one time, Uniden still provided service for the old Electra
scanners, but I am unsure if they still do. However, you could call Uniden
to see if they still carry replacement parts at the following number:
(317) 842-2483, which is their technical line. Hope this helps.

: >operator. I know that many states have laws against using a scanner in a
: >vehicle. I have the following questions:

: >1. Does the law refer to mobile scanners and therefore exempt handhelds?

Most of the laws do not even use the term "scanner" as the laws have
often been around for more years than the existence of scanners.

: >2. I believe that my FCC ham license exempts me from the law regarding
: >using a scanner in a vehicle. Am I correct?

As another post mentions below, the specifc language of the FCC
exemption mentions transceivers (but does not define what a
transciever is)

By the way, it is my understanding that of the handful of states that
have specific bans on radio receivers in cars that can pick up
police/fire/etc. EVERY such state law already exempts amateur
radio opertors specifically. That being the case, the FCC
preemption actually isn't needed for those states. The FCC
exemption is certainly worth having in case another state enacts a mobile
receiver ban and doesn't exempt hams. The FCC exemption is also
of value against local, couty and city laws that may exist or
be enacted in the future.

: Jim; the laws depend on your state. The exemption specifically mentions
: transcievers as being exempt. In the peoples republic of New York it is a
: violation of MV&T laws to have "any reciever capabile of recieving public
: safety band transmissions" I think the ANT covers hand held scanners. There
: has been a lot of discussion on whether the Ham exemption covers scanners
: and most feel that it dosen't.

That depends on the situation (IMHO). If I have a scanner in my
vehicle AND a transmitter or even just a typical mobile transceiver,
then I can certainly make a very valid argument that the scanner is
used in conjunction with the mobile unit to provide additional
monitoring capability...a function that many self contained
mobile units do. Bottom line is the FCC preemption has yet to
come up against a local scanner ban in a court case. I don't
think it will as even the NY law has a ham exemption as I recall.

What I wouldn't do is to have ONLY a scanner in the car and try
to claim the ham exemption granted by the FCC would protect me.

: This is all the more reason for Hams, ARRL etc to work and help
: get these laws removed. The airwaves belong (read are supposed to) to the
: people. It is up to us to tell congress and our other lawmakers which people
: we mean. Don't think it will get better just because you are a Ham, it will
: only take them a little longer to get to you.

That's what we did in NJ. Today anyone can have a scanner in a car.
We finally got the 1934 law changed to a new law which only makes it a
crime to use a scanner in the commission of a crime.

Cheers,

Yep. But once you show them it works they'll leave you alone. Whether
you can use it on board is up to the discretion of the pilot. There have
been reports of crews giving listeners the frequency the plane will be
using. There have also been reports of scanner usage being forbidden
during flight.

A friend of mine is headed down to Phoenix for the NASCAR race at the end of the month, and I'm looking for freqs. in the following stop-over cities:

Medford, Oregon
Los Angeles, California
Phoenix, Arizona

Just the basics (ie police, fire, ambulance, etc.) Also, is there a CURRENT list of NASCAR frequencies in use around? Something that I could get via FTP?

Any help is appreciated.

Just another reason why we should never permit our law enforcement agencies to adopt non-monitorable communications technologies.

it is one thing fora tactical/swat team to use crypto-radios in a sensitive operation, but it is quite another for the standard police cruisers to. Let's keep it open and retain our ability to keep tabs on what our police are up to.

I just returned from Las Vegas with my handheld scanner/2meter transceiver radio. I didn't get any static from the security guards at all. However, I flew Continental and they state before the flight takes off that you may not play scanners or radio receivers while on the plane. I covertly did so by using an earpiece after takeoff and before landing. Couldn't hear much though. I guess you should get the pilot's approval if you are going to listen for any extended period of time. The radio can interfere with navigational equipment. Good Luck.

: -Will Rogers

The "Gorillas in the mist" comment you refer to was acquired from the
data terminal record at the station, not from some scanner geek. The
police who provided this log could have deleted or edited it if the had a
mind to. You can't seriously be implying that people who monitor police
radio traffic keep the police from abusing power.

Besides, I think it was a "mild" comment.

Thanks Jonathan! I appreciate it very much. By the way there is a
really great Japanese Hacker Magazine available over there. It
has diverse topics ranging from how to break copy protection on
various software packages to mods to restore full coverage on
virtually all radios to even phone sex ads. Those Japanese folks
really know how to pack it all into one small book, that's for sure

The magazine is called "Action Band". And as you may have guessed
it is written in Japanese :-(

4254. Info on RS PRO-2002??

Newsgroup: rec.radio.scanner
Date: 1994-10-22 12:37:02 UTC
From: 5leitgeb_c@spcvxb.spc.edu
Message-ID: <1994Oct22.083702.1@spcvxb.spc.edu>
Source record: 266865

I've recently acquired an ancient RS Realistic PRO-2002 scanner in a trade
and I was wondering if anyone on the net has any info. on this scanner.
I'm looking in paricular for any mods(especially to improve the squelch
and speed up the scanning rate),and any information as to when this
scanner was produced and when it was discontinued by Rat Shack. I
would also appreciate any help in locating a manual for this scanner
since I did not receive one with it :-(Any help will be appreciated.
Thanks in advance.......Craig

I recommend you add a small heat sink to the TO-220 style tab
power transistors and regulators in the BC-220, BC-250, BC-300, BC20/20,
and other Electra models of that generation.

These components operate at high temperatures which decreases
their useful life.

REPAIR TIPS: BEARCAT SCANNER RADIOS |

Copyright 1993, 1994 by Bob Parnass, AJ9S |

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or |
publications which charge for service without permission of
the author. Free distribution is encouraged.]

Introduction |

The original Bearcat scanner line was manufactured by |
Electra of Cumberland, Indiana. In the mid 1980s, Uniden |
bought out the Bearcat scanner line and Uniden's first |
Bearcat scanner was the 800XLT model. |

Most of the models discussed in this article are |
base/mobile units made by Electra during the 1970s and |
1980s. Electra stamped all of its scanners with a |
manufacturing date code on the rear of the cabinet. The |
code is comprised of a single character (C = Cumberland, |
Indiana, P = Puerto Rico), followed by four digits denoting |
year and week the radio was built. For example, "P8422" |
denotes the radio was made in the Puerto Rico factory |
during the 22nd week of 1984.

Schematics and Parts Available |

Schematic diagrams may be obtained from Uniden/Bearcat's |
parts department, (317)842-2483. |

G & G Communications (telephone 716-768-8151) is a family owned company which repairs scanners and stocks parts for several older models, especially Electra/Bearcat and Regency brands. They are located at 9247 Glenwood Drive, LeRoy, NY 14482.

Electronic Repair Centers in Franklin Park, Illinois (telephone 708-455-5105) has been repairing Bearcat scanners for several years. They charge a flat $45 repair rate for programmable and $30 for crystal scanners, and shipping is extra. Electronic Repair Centers will fix Regency scanners if they can obtain the parts.

Bad Solder Joints Common

Before addressing specific symptoms, circuit boards in the malfunctioning scanner should be inspected for poor solder joints.

The Electra/Bearcat BC350, BC300, BC250, BC220, BC20/20, BC211, BC210, and BC210XL models were hand assembled, and every one I've serviced had several connections that were either soldered poorly, or not soldered at all.

Resoldering joints on the ribbon cable connecting the RF and keyboard logic circuit boards in a BC250 attenuated the microprocessor/synthesizer hash noise noticeably.

A Bearcat 20/20 was experiencing periodic loss of memory on some, but not all channels. When the problem occurred, the frequencies on some channels would be completely changed. On other channels, the frequency would still be intact, but the channel would be locked out, and the delay toggled from "on" to "off". Some channels were not affected.

The 2 "AA" memory backup batteries, and their holder, tested good. Much time was spent tracing logic, heating and cooling components, and making voltage measurements.

One of the secondary leads from the power transformer was connected to the main circuit board through a hole drilled through foil traces on both the top and bottom sides of the board. A close examination revealed that this lead had been soldered only on the top of the board - the bottom side had never been soldered.

Soldering the lead on both sides of the board solved the memory loss problem.

Symptom: Blank Display

The BC300 scanner, and several other Bearcat models, employ a switching type power supply stage to generate plus and minus voltages in excess of 20 volts DC. When this switcher fails to function, the display goes blank, but the

squelch control appears to work, and white noise can be heard in the speaker.

In two of the BC300 scanners I've fixed, C98, a capacitor in series with the primary of the switching transformer | failed, causing the output of the supply to drop below the | level needed to power the display. The switching transformer is mounted on the RF circuit board, and is much, much smaller than the main power transformer, which is usually fastened to the metal chassis. The 22uF/16V * capacitor used for C98 in early BC300s was marginal, and was replaced with a 47uF/25V capacitor in later units.

I recently replaced the 22 uF capacitor in the switching power supply stage of a BC210XL which caused the same symptom. Other capacitors in the switcher stage have failed. C114, a 4.7 uF/35V tantalum capacitor failed in at least one BC250, causing the display to blank.

A more sinister problem affects the switcher in earlier models. The switching supply stage in the BC250 and original BC210 is driven by a clock signal derived from a custom Exar NC57902 divider integrated circuit (designated | IC6 in the BC250 scanner). I've seen this divider IC fail in several BC250s, causing a blank display (except for a decimal point in the BC250's rightmost digit). This custom IC is no longer available from Uniden. |

Symptom: Invalid Frequency Displayed

A common Bearcat 250 malady is manifested by an invalid frequency displayed on the readout. This condition is temporarily "cured" by unplugging the AC line cord from the wall, then replugging it. This condition is symptomatic of a power supply problem in which Q204, a Texas Instruments TIP-29 located on the feature circuit board, fails.

A Philips ECG291 will work as a substitute for the TIP-29. | Don't try a Radio Shack substitute, it hasn't worked. See Martin Toomajian's article, "Bearcat 250 Erratic Display Cure", in January 1987 Monitoring Times. *

A similar problem in the Bearcat 20/20 was discussed previously in the section on bad solder joints. |

Symptom: Squelch Won't Eliminate White Noise

Most Uniden/Bearcat base/mobile scanners feature an AUTO squelch position, actuated by rotating the squelch knob fully counter clockwise. The BC350 used a separate pushbutton switch for this purpose. These scanners use a | flimsy potentiometer (designated R81 in BC300s) internally mounted on the RF circuit board, to set the level of signal

required to open the squelch when in the AUTO position. This pot also has an effect on the squelch action in the non-AUTO mode, and determines at which point the squelch knob must be positioned in order to silence the radio.

Although the potentiometer is adjusted at the factory, changes in component values due to aging often necessitate readjustment of this internal pot. Misadjustment of this pot has been the cause of "no squelch" complaints in two BC300s and a BC250 I fixed.

Another squelch failure is due to a blown transistor that acts as the electronic switch in the squelch circuit. I replaced this transistor in only one BC300, so I don't know if this is a common problem. |

Symptom: Scanner Completely Dead

In Bearcat scanners using an internal power supply (e.g., BC350, BC250, etc.), the main power transformer is connected directly to the AC line. Since the on/off switch is on the secondary side of the transformer, current flows in the primary as long as the AC line cord is plugged into an active AC outlet. These transformers contain an internal circuit breaker, not visible without unwinding (destroying) the transformer. The internal breaker is known to fail prematurely in a batch of Bearcat power transformers.

If your scanner is completely dead, check the primary of this transformer for an open circuit condition. |

Symptom: Keyboard Bounce

After much use, the Chromerics keyboards in Bearcat scanners start to wear out. The first sign of trouble is usually keyboard bounce on the most frequently used key, | e.g., the MANUAL key. Replacement keyboards are usually available from UNIDEN, but replacement requires dexterity, as one must take care not to tear the flat, flexible strip connecting the keyboard to the logic board. |

Symptom: Keyboard Completely Unresponsive

The keyboard matrix is "scanned" by the microprocessor. Another problem is when none of the keys seems to function; the receiver just keeps scanning in spite of key depressions. I found this condition in a BC210XL scanner owned by a heavy smoker. Perhaps nicotine smoke was to blame, as the resistance between two input port pins on the microprocessor was down to about 1000 ohms, fooling the microprocessor into believing that a key was stuck in the "down" position. Scraping the circuit board between the

two pins with an X-Acto knife fixed the problem. |

Other Problems

Complaints of low audio output and occasional microphonics |
in a Uniden/Bearcat 800XLT was caused by a bad 47 ufd
electrolytic capacitor in series between the external
speaker jack and audio amplifier.

> b) You don't want the government to find out what you're sending.

The concept of private conversation obviously doesn't appeal to you.
Have you ever wanted to have a private conversation? The government
wants access to transmissions because it is assuming guilt by
association with encryption. One is innocent until proven guilty
in this country.

> Perhaps you should rethink your angle on this. If you had a blanket
> covering a bunch of "stuff" in the back seat of your car, wouldn't you
> expect the local authorities to become suspicious? What if you didn't
> allow them to look underneath, even with a warrant?

If it becomes illegal to encrypt, that would be like making it illegal
to cover the stuff in your back-seat. I guess after that the
government would move to make it illegal to have locking trunks on
your car (or maybe trunks should be outlawed 100%), because of course
you're going to be carrying something illegal in there also, right?
Warrants are anothe matter-- you need a judge to get one of those, so
it's at least more difficult for the goverment to get in your way
there.

> Please don't get me wrong - I don't particularly like the idea of any
> "backdoor" on encryption. In fact, if the legislation comes up to
> outlaw private encryption, I'll be calling my rep on the hill to voice
> my opposition. All this just makes you sound very suspicious...

Guilt by association is a very nasty thing. My use of encryption
should not imply that I'm a criminal. If I've got a bunch of email
from my wife, I don't want the sysadmin on my computer reading it, I
don't own a computer at hom to store the information on, and I pay for
the preivelege of having disk space online for my use, why should I be
forced to remove the mail from the system, when I can just as easily
encrypt it? Is that legitimate enough?

Do you think law enforcement is 100% innocent? Heard any stories of
the local metro police being bribed by drug dealers, lately? Seen any
state cops doing 100mph on the highway, no lights or siren, no
emergency? Seen state-owned vehicles in blatant violation of
emissions laws? The state and its agents are not perfect. They take
care of their own, or whoever pays 'em enough. I think I should be
entitled to my privacy.

4259. RE: scanners on board planes

Newsgroup: rec.radio.scanner
Date: 1994-10-22 15:42:22 UTC
From: LPRICE@GSVMS2.CC.GASOU.EDU
Message-ID: <38bbsu$g1m@informer.cc.GaSoU.EDU>
Source record: 266868

Sorry, the advice that "use on baord planes is up to
the discretion of the pilot" is outdated ...that was
true a few years ago. For certificated airlines there
is now a FAR that prohibits any radio receiver use on
board. The obvious reason is possible radiation form
on or more stages of the LO. There are now three classes
of electronic devices on board (1) use anythime you
want (2) use except when plane is landing or taking off
(3) never use. Scanners fit in to category 3 above.

Best thing is to (a) listen in the airport and (b) consider
flying on an airline that puts the air comms audio on one
of the cabin headset channels.

4261. Help with Pro46 mod - soldering surfacemount diode

Newsgroup: rec.radio.scanner
Date: 1994-10-22 16:37:17 UTC
From: "Gregory yea... you can call me Greg" <gregmason@delphi.com>
Message-ID: <Z+8Va1N.gregmason@delphi.com>
Source record: 266871

Buoyed by my recent success with my Pro2006, (instaled the OS456) and the reports of the success of others with similar mods, I opened up my unmodded Pro46. No problem. Managed to oppen the case, separate the boards, desolder the shield without melting it. Found the diodes marked 000 (God theyre small!). No real trouble up to that point. Figured that taking the little 000 diode (for the uninitiated about the size of a small ant, and just about as easy to work with). Well, I found what I believed to be the correct solder pad, and attempted to solder my diode to it. Had a little difficulty there. In fact I think that it _might_ have been easier to actually solder a small ant in place that that diode!

I seem to have very slightly moved the solderpad out of its original position tho not so far as to be off of the traces. Finally I got the diode to stay on the pad. When I put the scanner back together, it still worked, but was in no way modified. Oh I neglected to mention above that I did in fact solder the diode to the pad. (tho i dont know how well I soldered it)

Two questions: How do you Solder such tiny components, and
Did Moving the solder pad (ever so slightly) my problem?

The former question brings to mind a third, if I did move the solderpad off of the traces, is it possible to get it back?

Any help with this prediciment would be greatly appreciated.

4266. Re: FCC regulations w/scanner

Newsgroup: rec.radio.scanner
Date: 1994-10-22 20:09:45 UTC
From: mulligan@ACM.ORG
Message-ID: <38bri9$idc@hopper.acm.org>
Source record: 266880

tbrutus@sunyboard.org asked:
> Can someone here help me obtain a copy of the very latest laws/regulations
> that have to do with scanners & cordless & cellular phones.

The rules and regulations of the FCC are codified as Title 47 of the
Code of Federal Regulations (cited as 47 CFR). They come in 5 volumes, from
$20-28 each and are revised annually. Scanners are referred to in Parts 2
and 15, both in the first volume. Cordless occurs in Parts 15 and 68, and
Cellular is in Part 22.

Permanent laws are codified as the United States Code (USC). Most Acts
of Congress are Public Laws (P.L.) which modify sections of the code. Of
interest are:
Communications Act of 1934
The basic telecommunications law of the United States. Codified as
Title 47 of the United States Code (47 USC). Amended many times.
Electronic Communications Privacy Act of 1986 - P.L.99-508 (Oct 86)
Amended 18 USC (the criminal laws) to ban reception of cellular.
Telephone Disclosure and Dispute Resolution Act - P.L. 102-556.
Amended 47 USC to ban cellular capable scanners (Oct 92).
Digital Telephony Bill - just passed, don't know its designation.
Bans reception of cordless.

Members of Congress are given a limited supply of new bills to send out
in response to querys, but this only covers bills under consideration or
recently passed. For volumes of the USC & CFR, as well as collections of
laws on certain topics, the Government Printing Office is the source. The
GPO operates bookstores in major cities or can be reached at:

Superintendent of Documents
Government Printing Office
Washington, DC 20402
(202) 783-3238

A few notes: Many laws are packages of (distantly) related items. You
may have to dig to find the part relevant to you. Many also contain wording
of the form "... strike out the last 3 words of 47 USC 302(d)(5) and add ...",
which may not give you much idea of what's really happening unless you've
got a copy of the law being amended (and you're a lawyer <g>). The GPO has
a copy of the Comm. Act of 1934 for sale, but I believe it's about a decade
out of date. They do offer the entire USC on CD-ROM, which is one of the
best buys around.

If you're travelling by air, it's expressly forbidden to listen to a scanner or any elecronic radio device while the flight is in progress. Something to do with scrambling of the transmission of signals from the plane to the control tower. How true that actually is I'm not sure. Amtrak or Greyhound is no problem as long as you have earphones, so it won't disturb anyone else. Check into this with the airlines, and if you hear anything, please email me with anything you hear. I'm interested in what they (airlines) would say.

Later,

Tom (tbrutus@sunyboard.org)

Make sure your complete email address is in your response. Thanks

So how did he vote on the scanner ban of 92? How did he vote on the DT
bill? It seems more relevant to be discussing the person's voting record
than it does how many awards he has been received.

Jason,

I have been on that bulletin board before and it seems to have some
good things, but when I try to download files, I cannot find where
they go on my computer. I would think they would go in the Windows
directory, since that is where Terminal is installed, but they are not
there. Could it be that they are not downloading properly?

Thanks in advance for any help,

David

This is exactly one of the key issues raised by the DT bill: since theft
of service and fraud are already criminal offenses and ar clearly sufficient
to to indict and convict such activities and since civil relief is available
to extract monetary damages, why then is such a law necessary?

The scary thing about his law is that if you have a scanner and a computer
interconnected and for whatever reason are raided, then how will anyone
really know whether they were connected together and had software installed
to simply manage lists of frequencies and control the scanner therefrom,
or were connected together to extract ESNs from cellphones to enable
cellphone fraud?

Certainly an expert scanner / radio person would easily be able to
make such a determination, but one has to wonder if, in the process
of dismantling the equipment, critical connections are noted properly
in terms of what was connected to what and what software was in there
and if it is actually capable of doing what the prosecution would like to
charge you with.

It is unreasonable to expect the average cop to be competant in this area.
Soit seems that one could be engaged in a perfectly lawful activity when
you are raided, (for whatever reason) and then have charges of cellphone
piracy levied against you irresective of whether or not they are true.

Even if you are not convicted, you will have a big problem with time and
money during the intervening time.

--
On the equipment side of the business, itis possible that the scanner

manufacturers may be required by some future FCC rule change to not include a serial port in the units "since they can be used to break the law if they have that feature". This is applying the logic of the scanner ban of 1992 to the DT bill. It is very conceivable that this may come to pass.

Also note that homemade "black boxes" willbe viewed with particular suspicion. It is one thing for the law enforcement types to be educated that a particular set of well known commercial products is deemed "OK" by the technical services divison, but that experimental DSP audio filter you are working on looks pretty suspicious. The tech guys say that a DSP looking at an audio stream is certainly capable of decoding FSK data contained therein. On the other hand, it may be that the thing is simply an audio filter. The software would have to be studied to ever decide for sure what all it did, and even then it would be very difficult to ascertain all of the capabilities.

This would be a very expensive undertaking as people with these capabilites are highly skilled and are generally paid very well.

So as you can see there are some pretty difficult issues that are quite easy to identify with this new bill which has passed both houses, one unanimous and another by a voice vote. There are a number of other issues raised by it that have not been discussed.

Finally note the original point of this posting, which is that the law is unnecessary, is redundant and in the attempt to restrain certain activities already illegal, has created a structure which has some serious allegedly unintended side effects.

I think that maybe we should have a voice vote on whether the congress that passed this abomination deserves to go back for another term. I suggest we all bear this story in mind on November 8.

>
>

Thansk for the exact names of the standards. Are they available for
the general public to read and understand?

As far as computers, DSP based decoders being in the future of scanning,
if the rate of encroachment of the rights of radio hobbyists are not
stopped, the law will not permit this to occur as it would naturally.

It is imperative to note this, understand this, and to remember this
when you vote on November 8. The congress has recently passed the most
sweeping restrictions on radio operation and possession since the original
FCC authorization and they are all up for re-election on November 8.

Give them what they deserve!

Source record: 266767

I was up in Canada the other day, (my cabin is one mile south of the USA/Canda border) and I just bought an AR1500. I was comparing the 1500 to my Pro 43 in
differnet ranges, and I tried out the 868-896 rage. The 1500 manual says to use 12.5khz steps while the 43 uses 30khz. Which is right? I was getting hits using both steps. I was getting hits on the 1500 where the 43 couldn't go, and visa versa.

Anyone have a comment on this?

Hello;
I've been a SW listener/DXer for a few years, and yesterday
my hubby gave me a scanner for my birthday. After fiddling
around with it I've found these law enforcement freqs:
152.885 154.385 154.860 154.755 155.010 155.070
155.130 155.310 155.580 155.640 460.500 460.275
460.050
and I read that 154.815 is used for surveilance.
Where can I find EMS/Fire frequencies? It's a Pro-23 so
if they're in low band I'll have to do without.
Thanks.
Jill

4282. Cordless phone and false ringing?

Newsgroup: rec.radio.scanner
Date: 1994-10-23 01:15:28 UTC
From: Dave Shaffer <DCS4@psuvm.psu.edu>
Message-ID: <94295.211528DCS4@psuvm.psu.edu>
Source record: 266893

That may sound like an odd subject line for this group, but
I hope it makes sense in a moment.

In the past ten days, I've begun to receive odd calls at
my home phone number. The phones will ring, but when I
pick up a receiver, there is no one there, the line goes
dead, there is a clicking noise and then a dial tone.

My first thought was that it was some prank caller. But
before I go overboard on that analysis, I wonder if the
problem could be caused by my cordless phone, and I'm posting
this item here to see if any readers of this group might
have some insight into the situation.

More specifically, could it be that one of my neighbors has
installed a cordless phone that operates on the same
frequency as mine...and incoming calls at that residence are
triggering the ringing at my house?

I have more than one phone in the house, but only one cordless.
These odd calls have begun only recently. I've observed maybe
one a day at various times when someone is home. I did try
using a *57 to trace of *69 to call back but in each case
got a message that said the call originated outside the local
phone service area.

Using my handheld scanner, I did identify the frequency on which
my phone operates, but I have not observed any unusual activity
on that frequency...or a strong nearby signal, for example.

I did get such a call earlier this evening, and have since
unplugged the cordless phone. If the calls continue now, logically,
I can eliminate the cordless idea.

Other possibilities? Am I on the right track suspecting the
cordless phone as the culprit in this scenario? - Dave

4283. change that CHP to Sacramento County Sheriff

4284. 800 Mhz Block Converters Still Legal?

Newsgroup: rec.radio.scanner
Date: 1994-10-23 02:42:25 UTC
From: g9153402@huey.csun.edu
Message-ID: <38ciii$ng@nic-nac.CSU.net>
Source record: 266895

I was looking through a recent Tucker Electronics catalog (800-527-4642) and noticed they had a block converter kit, that pushed the 800 - 950 Mhz band down to a lower frequency range. Are these things convered by ECPA, or is this a loophole in the law? I think the law covered 'easily modifiable receivers/scanners', but I don't think these things are receivers, since all they do is shift frequencies, before they enter your scanner at the antenna connection. Does anyone know?

> Thanks
> Tim

My guess is, since I don't own one, is this is a good converter,
it should shift every frequency exactly 400 Mhz down. As far as
images, they are a product of your scanner, not the converter.
If you're using a very good, triple-conversion scanner, and there
is no frequency leakage in your antenna connections so actual 400-500
mhz frequencies aren't interfering with the 800 mhz ones, it should
work.
I do, though, own an old block converter that pushed the cable-TV
frequencies onto the UHF television band, so many cable channels can
be received on older-type televisions. It worked, but the reception
wasn't that great.

And what about people that close the bathroom door when they're
takin a dump? And what about people who close their eyes when they
think?
I realize, of course, that many people grew up in abusive
situations in which their parents or whoever even took away their
bedroom doors (see War On Drugs, and Family Values) maybe because
their parents never individuated from their own parents (perhaps
because they were forced to live under similar situations and abuse)
and that this sort of abused mentality, one in which the abused gives
up all rights to privacy to whatever authority figure, is now
pervasive in the thinking of many people. Both among people
in the government (see Lucky Luciano's friend J.Edgar Hoover, see Clipper
Chip and War On Drugs) and people everywhere else. It's about
control.

I just bought a PRO-62 and I was wondering if it is better than the
PRO-43. From what I read on the newsgroup the PRO-43 seems popular.
I looking for a good handheld scanner that can be easily modified...
I am new to scanners so any information would be appreciated. Is there a
better handheld available in the $300-$400 price range...

Craig.

Chris:

As a Firefighter and driver of said appparatus WHERE IS YOUR @#%$#@ HEAD,
its people like you that I would like to hang from your tally wacker and
beat the @$#$#@$ out of you for suggesting that someone pull a box alarm
just to see what the frequency is. do you understand what the danger is
involved when some asshole does this, equipment needlessly responding,
Other drivers and pedestrians put at risk due to the equipment responding.
I know some Firefighters that would just about kill you if they catch you.
You are a sick person! and need help! I can't believe you would do something
like this, just to get your jollies off and to see what a frequency is.
Would it not be better just to call or stop by the station and ask, or are
you afraid to show your face around the station for fear of being
recognized, You are probably the reason they had to put the dye on the
alarm boxes,

Mabe I'll call you local Fire dept. and let them know what kind of sick
idiot they have in thier area, since I know have your phone number, they
could check and see if there have been any false alarms in that area that
you live!

Shannon:

Don't take this SOB's advise, it will only cause you trouble in the long run.

Randy

Oh ya, I would have E-Mailed you directly, but you needed a good chewing on the net for such a stupid idea.

Having recently purchased an R9000 I'm now looking for companion software packages to control it from a PC.

I would ideally like to control it from my SCO Unix machine but would like to find _any_ software.

I suppose whatever is available would also control my R7000?

Thanks in advance.

> take it on
> board and listen in ...

> Will the security guards hassle me when they see a box with an
> antenna in my
> bag?

I flew from Calgary to Toronto last April and took my PRO-44 with me. I carried on my everpresent college-size backpack [hm, now that didn't sound right.. you know what I mean :)]. It passed thru the machine, the guard at the end said "THIS YOUR BAG?", I replied, "uh, yeah." "CAN I LOOK IN IT?" "Sure, no sweat" She opened it up, peeked around, "Oh, a scanner," zipped it back up, "Have a nice flight"

I didn't bother to listen to it on the plane, but contrary to what someone else said, it's not illegal to listen. You just have to get permission from the pilot first. Not the attendants, not the baggage handlers, THE PILOT.

Hi,

The main part of my scanning hobby is listening to the UHF military airband here in the UK. A large amount of US military aircraft entering UK airspace can be heard from my QTH so I would like to make contact with other monitors state side who also enjoy this hobby. I have a lot of callsigns, base frequencies and stud tie-ups for aircraft based in the UK which I would swap for any info on the US scene. Anyone interesed please email me, thanks in advance.

If RS has done it right, and only time will tell, there is just 1 mod for the PRO-62. It does not require tools.
(1) Sell Pro-62
(2) Use proceeds to buy some other unit that has already been modified.

I haven't seen the 62 yet, but its specs look promising (triple conversion, etc.). However, if modification is important to you, I would scour the neighborhood for a PRO-43 without an A in the serial number--even if it meant buying a demo--and return the 62. There is always the chance that RS (or, rather, a supplier) screwed up again and that the 62 is modifiable, but I would keep one eye in rec.radio.scanner looking for mods and the other eye on the calendar looking at the 30-th day after purchase.

: > well as Cellular calls. The state passed a law specifically stating
: > Cordless phone.

: Actually, now it doesn't really matter where you are, if it is an area that is
: under the control of United States laws. The recently passed Digital Wiretap
: Act included the removal of the exception for cordless phone in the ECPA. Now
: cordless phone falls under the same restrictions as cellular, atleast as far
: as the ECPA is concerned. There has been no change (yet) to prevent the
: manufacture of cordless-capable scanners...I guess the 103rd Congress is going
: to leave that up to the 104th...

Of course, what good it will do them (I mean the passing of a law, like we really care? Like we are actually going to obey it? <- NOT!). It's only as good as it can be enforced. If the police did not have radar, and had to catch up to you with their car - calibrated to determine your speed, take a guess how many would speed! The point I am making, there is NO MEANS TO ENFORCE THE LAW in the privacy of your home or vehicle. Oh sure in some places the vehicle part could be questioned (if "installed or present") but as to what you are listening to, unless you are a total fool, you are damn safe, ESPECIALLY at home or using headphones/earphone etc when outside.

As to the cordless frequencies, they can be monitored using modified baby monitors, other 10 channel cordless handsets, kiddie-talkies, you name it. They can not and will not ban scanners with cordless frequencies. If they DID, you would find the top line portable phones of 10 channels and no scrambling all in immediate VIOLATION, since unlike the cellular, they will actually scan for a free channel to use and all have four or more (of the decent ones). Mine will do them manually or scan mode, and I have it for listening to other cordless phones! IOW, they work differently!

As I said in an earlier post, I have not found one person to date who is going to stop listening to their neighbors cordless phones "because of the new law". I have not heard anyone say they are quitting for any other reason either.

So, boneheads in DC, let's face it. You make a crummy law, everyone IGNORES it, what are you going to do about it? Not much except whine like a legal mouthpiece about how it's wrong, etc. Well if that's the case, how about mailing me payments EACH and EVERY month and LEASE my AIRSPACE for your calls? I OWN my airspace, and I shall monitor cordless, cellular, you name it -- and there is NOTHING, that is N-O-T-H-I-N-G you can do to stop me.

Oh sure, you can state "penalties", but catching a person in the act, well, let's say when you have the drug and prostitutes problems under control, also the credit card fraud problem under control, then MAYBE you may have time to chase the scanner owners, but let's face it, you're understaffed, outnumbered, and no means to get a judge to issue a no-knock warrant on the grounds "you believe there is an active monitor of cellular or cordless phones in the premises located at xxx xxxxxxxx xx".

Give me a break! There is NO WAY to enforce this law, and with the new vice they can sell more since it is now legally private, I/we will have MUCH MORE to listen to, not less.

GG> find the rules to work in your defense is in the back of the travel
GG> magazine in the seat...

GG> ...That is my bright Idea. I would like to hear yours either...

IMHO you are a dangerous jerk.

Why would you hide your equipment from the flight crew? Does that mean that you feel that you are above rules and regulations that are designed for your safety and the safety of others? Even if the airline that you are flying is wrong about the safety of scanners (and I believe that scanners are generally safe) what harm could it do if you showed a little maturity and refrained from using your scanner during the flight? At worst you might have to do something else and if the airline and the FCC happen to be right, you have avoided creating a potential disaster.

BTW, what kind of scanner do you have that transmits? Are you carrying a portable airband transceiver onboard? That would make you juvenile behavior even worse.

People like you make life very difficult for those of us that take the scanning hobby seriously. Your kind of irresponsible behavior has resulted in the current atmosphere of anti-scanning sentiment. I certainly hope that you do not drive your car or conduct other aspects of your life with the same reckless disregard for others; but I have my doubts.

I took my 2m transceiver and two scanners to Denver last summer. Never had a problem carrying them on to the plane or using them on the plane. I flew Delta and Delta allows the use of <VHF scanners> by name in their Sky magazine. They only allow in-flight use, not during takeoff or landing. I didn't hear much, I was so excited to be on a plane for the first time in years that I didn't turn my scanner on much.

I would suggest getting icom.c off the internet via an archie search or
some such, and then modifying it for the 7000/9000 extensions.

You can get the specification for the RS-232 / ttl /multidrop protocol
called C-IV from Icom documentation directly for about $25. It is titled
"CI-V Icom Communication Interface - V Reference Manual." I have seen the
third edition, but don't know the latest version.

>I suppose whatever is available would also control my R7000?

For the most part it is true that the R7000 and 9000 command sets are the
same. The differences are in the 'scan edge channel' commands and those
dealing with modes not supported on one but on the other (e.g. RTTY,
wide-FM, CW, etc.)

One final note, I did talk to the folks at Ham Radio Outlet, and they
claimed they have radio control software which will operate at
least some Icom radios, but I do not know which model numbers.
The radio control programs available commercially are usually
directed at the kenwood receiver/transceivers.

I just bought a Pro-43 last week here in Calgary, Alberta, Canada. I am now wondering if this unit can be modified for cellular coverage. This radio with Canadian DOC certification markings has serial number 084730. The box has a small sticker that reads 3A4. Does the same rule about having an A in the serial number apply to radios made for Canada?

Well, her in Orange County, CA most of the PDs are making one of two moves.
Either they are going to computer-based communications for dispatching and
car-to-station communication, or they are moving to a new trunked system to
be installed over the next four years. Of course, short-range car-to-car and
tactical frequencies will still be carried over the radio, but even that is
up in the air right now.

To enter "memory mode", press MR. Then a small "M" will appear down and to the right of the center of the display. In "memory mode", it will do "memory scan", "memory skip scan" and "mode select scan".

You have to be in "VFO mode" to search or do an auto-write scan. You enter "VFO mode" by pressing CL. (Search is called "programmed scan" in Icomese. There is also available "programmed skip scan".)

The manual explanations really are cumbersome.

4312. Canadian Scanners

Newsgroup: rec.radio.scanner
Date: 1994-10-23 21:29:09 UTC
From: netowns@netowns.bcsc.gov.bc.ca
Message-ID: <1994Oct23.142909.5517@venus.gov.bc.ca>
Source record: 266779

I am wondering if someone can answer a question for me. Before the summer I was reading numerous posts about US Scanners having cellular capabilities disabled and many people saying they would now have to get their scanners from Canada or the UK if they wanted to do cellular mods.

I have a friend who just purchased a Pro-43 and when attempting to do the mods to make it cellular capable, he noticed there are only diodes D1 and D2. Therefore, the mods that are posted could not be done. His model number is 20-300 *not* 20-300A but his serial number is A00xxxx which is lower than my serial number of 06xxxx (no letter A preceding) which was bought about a year ago.

I have not been reading the posts for some time and was wondering if I missed something where Canada was following the US lead and discontinuing cellular capability. Comments?

4313. ? for other Yupi owners.

Newsgroup: rec.radio.scanner
Date: 1994-10-23 21:33:38 UTC
From: habu@gate.net
Message-ID: <38ekri$1aeh@tequesta.gate.net>
Source record: 266777

I recently bought a Mvt7100 and am having problems with it scanning
certain frequencies. It off and on seems to hang on certain freqs mostly
in the 164-168 and 414-420 range. All the channels are fed mostly Atf\Customs
and Dea it usually hangs on the same 5 or 6 frequencies. The problem is
intermitent and can solved by using the attenuator key. Could this be
a problem with the yupi or is it interference of some sort. I also am
wondering if it could be internally generated noise or could it be weak
signals. The signal bar usually displays about 3 to 4 bars when the channel
hangs.

Thanks Mike

4317. Pro-43 on sale at RS for $260 U.S.

Newsgroup: rec.radio.scanner
Date: 1994-10-23 23:40:14 UTC
From: hancock@access.mbnet.mb.ca
Message-ID: <38es8u$3td@canopus.cc.umanitoba.ca>
Source record: 266784

Just got back from my local RS and noticed the Pro-43 on sale for $349 Cdn which is roughly $260 U.S. If you've been waiting for this scanner to go on sale now's the time to head down to RS and pick one up at a great price. I don't know if this sale is nation wide or what RS's policy is regarding matching sale prices in other parts of Canada. Any Americans close to the U.S./Cda border my want to make the trip into Canada to pick one up but I would suggest confirming the price with the specific store before leaving. The Pro-43 sold in Canada can be modified as there is no restriction on selling cellular capable scanners here (yet).

I also noticed RS is selling the Pro-51 and the Sport-Cat. The Sport-Cat had a black case and sells for $499 Cdn.

My area has a 800 mhz trunked radio system for public safety.
Occasional I get cellular phone interference over my car's scanner.
What causes this?
Also, why do they have to block out a channel?
Is this done to dissuade scanner listeners or what?
Any explanations would be appreciated.
Thanks,

4319. Good cheap antenna

Newsgroup: rec.radio.scanner

I found a way to make a real cheap, sensitive antenna for a portable or base scanner. All you need is a short length of electrical tape, between eight and 10 feet of a single strand telephone wire, and a twist-on BNC or other antenna connector.

You strip one end of the telephone wire and snake it into the middle prong of the BNC connector. Tape the wire to the connector with the electrical tape and you have a good antenna that takes little time to make. I use it for my base scanner at home -- I get 40-mile low-band range, 30-mile high-band range, and decent performance on UHF and 800 MHz monitoring.

Merry monitoring!!!

Michael Wallach
mjw@pfzrfsg.com

PB> I mean, being a "system spervisor" doesn't give you the right to
PB> criticize other people behavings anonymously

You are right again. Being a system supervisor gives me no more right to criticize someone then any one else. The opinion expressed was my own and not the result of a specific position

PB> ... like you can do to your system users with "Do that and Don't do that"
PB> messages, that I guess are very frequent at pfzrfsg.COM.

I have never found it necessary to issue "Do that and Don't do that" messages on my system. That is because I do not and should not censor anyone. We are all adults and SHOULD take the consequences of our own actions.

That said, my opinion does not change. Hiding one's action is an admission that that the individual KNEW the action was wrong. Trying to avoid "problems" from a flight attendant to satisfy the desire to use the scanner is at best very selfish. As a long term scanning hobbyist I do not appreciate the actions of individuals that put any aspect of the hobby at risk and I especially don't like having my safety at risk.

I have used my scanner many times while flying. In every case it was with the expressed permission of the cockpit crew. On more than one occasion I was challenged by a flight attendant. A few seconds of conversation letting the attendant know that I had permission or that scanning was consistent with the company's policy ended the "problem" and let BOTH of use enjoy the flight. In those cases where I was told not to use the scanner, that was that, and out came a book.

As I implied in my original message, attempting the covert use of a scanner on an airplane can serve no purpose other then to satisfy the lack of impulse control demonstrated by Greg.

It is actions like Greg's that give this hobby a bad name.

Hi There...

Don't know about using them on BA flights, but from my year over there, they are legal. The only restrictions that I could find (ok, not that I was trying very hard...) was a ban on listening to police and/or emergency services.

The cops around where I was ran a sting about once a year. Last year, they announced that a UFO had landed in so-and-so's field and that no one was to approach it until the RAF showed up. Nabbed 12 scanners/gawkers.

Cheers...

>them in my regular NiCad charger?
>George - segenreich@delphi.com

I've found them at various sporting goods stores and drug stores. If you go to a hardware store and ask they can often order them... The numbers above belie their real power...

Alkaline batteries are rated at 2.7 or so AH, but they only DELIVER this much current in slow-drain situations. Since scanners are fairly low drain, they are good for this application, but transmitting on HAM HT's or charging flash tubes are HIGH drain and the effective yeild of Alkalines are only about 0.9AH. Nickle Hydride batteries will deliver a real 2.7AH even in HIGH drain situations, so they are well worth their price for ham and other applications, but not all...

An added bonus making them (possibly) worth their price in other applications is their long shelf life. They retain some 85% of their original power even after 10 years, making them good for emergency packs.

Somehow this reminds me of the person who bought a scanner from Radio Shack, took it home and brought it back the next day complaining that it would not transmit. The store clerk promptly wrote up a repair tag stating "does not transmit". The repair tech returns it to the store several days later after marking the tag "unable to duplicate problem, please supply microphone customer was attempting to use!" One week later the store returns the scanner to repair with the tag now marked "microphone not in box, please order proper mic from National Parts and bill store per manager." Makes you sort of wonder. Honest story, I know the tech.

: Paul, I also own the original M400 and spoke both to Fred
: Osterman at Universal and the software programmer of the M400
: in Florida (the name escapes me and I am too lazy to look at
: my notebook). BOTH mentioned an upgrade to 1200/2400 POCSAG
: may never happen....

When I spoke with the company which MAKES them for Universal, they indicated an inexpensive upgrade at the end of the year. The only problem they knew was a chip change (EPROM) and that the newer units had more onboard RAM -- which would not be a problem with the older units if you used an interface to a computer to read the data. This change was made due to higher speed.

Now, if Universal has decided not to do this, I will have to see if we can deal with the company that makes them - direct or perhaps I can pay someone to dupe the EPROM and solve the problem.

I guess this means there may be some of these for sale at the end of the year -- for the unsuspecting -- to enable their owners to upgrade to the newer ones.

Ahh, but you miss the point here.
The authorities are most welcomed to lift up the blanket _IF_ they have a
warrent _AND_ they are capable of doing so...

Is it _my_ fault they lack the capabilities to lift my blanket?

Yeah, sure, they want the right to ban people owning heavy blankets, just
because they aren't able to lift it up...

Woe be the day, when the govt bans particular locks just because he can't
find a locksmith to pick it, and he can't find anyway to cut it..
(He'll probably want to ban the material used to make that lock too)

If the last paragraph refers to NiMH cells, it's wrong.
NiMH cells self-discharge at upwards of 3 times the rate of Nicads.
So they will be dead in a matter of weeks, and unuseable in a matter of
days.

4336. How about PHILLY scanner newsgroup

Newsgroup: rec.radio.scanner
Date: 1994-10-24 13:23:07 UTC
From: scan911@aol.com
Message-ID: <38gcfr$l0i@newsbf01.news.aol.com>
Source record: 266824

If you are in the Philly area and you'd be interested in reading a newsgroup for scanning JUST for the Philly area and surrounding areas in PA-NJ-DE, then .... come visit the phl.misc newsgroup for a thread we have started for scanning in Philly. Post your favorite Philly frequencies. Ask questions about things you are hearing on your scanner in the Philly area. If we show enough interest by posting under the scanning thread in phl.misc, we'll be able to create a phl.scanner newsgroup. We all know scanning is something more regional than other radio hobbies, and some of us don't want to scroll through all the messages in rec.radio.scanner just to find something of local interest. So...here is your chance! Come post in phl.misc and we'll convince the phl. newsgroup administrator that there's enough of us out there to create phl.scanner!!!

73,
Chuck Gysi, N2DUP

It is known as my right to privacy which I had before Bill Clinton
became President.

> Perhaps you should rethink your angle on this. If you had a
> blanket covering a bunch of "stuff" in the back seat of your
> car, wouldn't you expect the local authorities to become
> suspicious? What if you didn't allow them to look underneath,
> even with a warrant?

I have a blanket covering some chairs in the hatch of my car. I
don't expect anyone to be suspicious. If a law enforcement officer
stopped and asked to see what was under the blanket, I would show
him. But, "what if" the blanket was covering a legal pornographic
film collection and I was concerned that the police officer might
treat me differently after seeing it, should I not have the right
to decline to uncover it in the absence of a search warrant. If
the officer gets a search warrant, the warrant will state for what
the officer is searching. And upon service, I am required by law
to allow the officer to remove the blanket.

Wiretapping is different because it is not a search for specific
contents, it is an authorized invasion of privacy for the purpose
of snooping for evidence. The courts have established that law
enforcement agencies can engage in such authorized invasions. But,
nowhere is it written that the subjects of such invasions are
required to cooperate. I fail to see the difference between using
a encryption methodology that is unbreakable by the FBI and using a
English language, verbally transmitted, code word methodology.

Now given that the FBI has an authorized wiretap and comes upon a
encryption methodology that they can not break, I see no reason
they should not be permitted to purchase the encryption methodology
or get a court order to have the vendor give them the methodology.
I believe there are precedents for both. The only problem they
really have is if the "wiretapee" has a home-grown methodology.
Now how likely is it that that would occur.

IMHO - this is the proverbial "tempest in a teapot" being stirred by a government official who was thinking outload about extreme measures.

Dick - These are my personal opinions - I am unaware of the opinions of the University in this matter. It is also my personal opinion that drug dealers and their financiers should be receive the death penalty.

I wonder, what is the penalty for "Unauthorized Cryptography"? Now you are a criminal. Let's assume that you are the criminal. Hipothetically, ok? I guess that if you encrypt your data, someone will be knocking at your door. But then, if someone knocks at your door, he will be saying, clear as a bell "Hey, look, I'm wiretapping you and you are encrypting your calls, stop it." Isn't that odd?

My guess is that if you "Illegaly" encrypt your conversations, no one will say anything, 'cause it'll be like addmiting they are taping you!

But then, "accidents" do happen...

Arik

Ji> I am wondering what kind of battery life the Pro 43 has. I have a
Ji> BC2500 and it gets about 6hrs. Does the 43 get more?

Bob Parnass posted a message awhile back that he gets a little over 6 hours with his ni-cads, I think. However, RS does sell hi-cap ni-cads that could get you 8 hours or so.

I get about 5 hours on the pack with the 2500XLT. The 2500 is about to be discontinued and the Uniden Bearcat 3000XLT will be on the market in December. (maybe) It will use the same pack as the 2500. There is a company here that was working on an extended time pack for the 2500. Because of the little interest in the 2500, the project was abandoned. Maybe life will be breathed back into the project if the 3000 shows promise.

>
> Will the security guards hassle me when they see a box with an antenna in my
> bag?

I've traveled many times with my AOR scanner, and never had a hassle. Once a securit guard teased me about it, but nothing serious - it was a slow day for him!

On the plane, I've been told every time by the flight attendants not to use it during the taxi, takeoff, climb, or the descent, landing, and taxi phases. I.E., the cuise is acceptable, but boring.

I also couldn't receive much in the air - my antenna wasn't on the outside of the plane except the plane itself. I could _see_ the tower antennae, but I coulnd't pick up the towers responses to the pilot.

You should be able to ask for frequencies on the net for various airports you are going to. rec.radio.scanner has been a great help to me on trips. Be sure to ask more than a few days in advance! :-)

Moral: Use the scanner in the terminal during layovers. Much more fun.

> for anti-theft reasons.

There is also the other side of keeping a low profile in your car. Its been
my experience that legal or not it is generally best if you avoid pulling up
next to a police car while your scanner is turned up full blast and all car
windows are down. They aren't as likely to know what you've got if you don't
advertise it!

The other easy thing to do is get a ham license. Anyone that is interested in
radio or electronics will be able to pass the written test for the Technician
license with ease after a few days of studying, and there is no code test for
the Technician class license. All states that ban scanners in cars exempt
holders of ham licenses, so that gets you past the state law problems, and
there aren't that many cities and counties with their own ordinances. It will
be the best money you've ever spent, and whats five dollars and some change
after you've just shelled out $300 for a good scanner!

I beleive scanners fit into category 2. I've read many different airlines policies, and most place scanners into the second category. In fact, every time i've tried to use mine on board, a flight attendant has reminded me of the rules, and cited the phases in your category two as prohibited times.

Also, (please correct me if I am wrong), the FARs leave the decision up to each aircraft's operator or carrier.

Too Bad you missed the point!. What do you think would happen to the
hobby if a plane went down killing a few hundred people because it was
found that a scanner caused a malfuction of one of the aircraft systems?.

You do not need to have a transmitter to radiate a signal. More and more
aircraft systems are computerized, and if you have ever had your scanner
near a computer, you would know the interference is not just one way. I
have seen the local osc. of a scanner put out a -10dBm signal!. This is
more than enough to cause interference to the aircraft comm systems
and/or control systems!.

Finally, the flight attendants are considered part of the flight crew and
Do Have the authority to not only take your scanner from you, but arrange
to have you arrested by Federal Air Marshalls at the destination!

Is It Really Worth Being So Stupid???!

Think About The Other People On The Aircraft (if not yorself)

Think About The Image Of Our Hobby You Present By You Actions.

This Was Not Opinion, Its A Fact.

4348. Re: radio interference

The channel that is "blocked out" is probably the data channel for the system. All the radios on a motorola trunked system are constantly talking back and fourth with the control computer over this channel. The system in use in our area rotates the data channel several times a day.

Hope that helps...

Mark

>Gailen's SS? Perhaps all comm software should be outlawed... It is
>conceivable that a virtual Patrick Purdy could be using MS-Windows
>Terminal to clone OKI-900s or Nokias or.....

As you said this is ONE of the charges. If two people plan to commit an illegal act (even a misdemeanor) then one of them carries out an overt act to facilitate that crime (writing software) it constitutes conspiricy (a felony). Writing the software was probably an element of one or more of the charges against them. The Merc article was probably not clear enough for us to be sure.

IMO these guys deserve more than they would probably get from the California judicial system if convicted. Fortunately most of these cellular ripoff operations are covered by federal laws where convictions are probably more likely.

Scannermaster (thejanitor@delphi.com) wrote:
: My area has a 800 mhz trunked radio system for public safety.
: Occasional I get cellular phone interference over my car's scanner.
: What causes this?
: Also, why do they have to block out a channel?
: Is this done to dissuade scanner listeners or what?

If you're referring to that annoying buzzing noise that switches daily between channels, that is known as a "handshake" channel that tells all the radios from each fleet which voice channel to switch to. This channel is changed daily to ease wear on the repeaters on the trunked system. This is a standard feature in all 800 MHz trunked systems. Here in Rochester, Kodak uses a trunked system for security, trucking, fire, and other services at its operations here -- almost like clockwork at 12 midnight -- the trunking control computer switches the channel and you get that familiar buzz on a channel that is not locked out -- you just unlock all the channels that buzz and lock out the channel that does.

About the cellular interference -- it might be a case of "intermod" -- the frequencies mix so it ends up mimicing a frequency on your scanner -- it happens mostly on the UHF frequencies -- not much you can do about that unless you can put a CTCSS tone board in your scanner.

Happy Listening!!!!!

Okay, so why can't you listen to your scanner while the plane is on the ground? Is there a greater chance of causing interference because so many other planes/towers are around?

Do HT's cause more/less interference than a scanner while receiving? (of course they do when transmitting...)

>Oh.
>You're right, the world will be a much better place when law enforcement
>can listen in on everybody's conversations without a warrant. None of
>those nasty technicalities to get in the way like that silly, old
>Constitution ...
>A refresher:

>Amendment IV.
>The right of the people to be secure in their persons, houses, papers,
>and effects, against unreasonable searches and seizures, shall not be
>violated, and no Warrants shall issue, but upon probable cause, supported
>by Oath or affirmation, and particularly describing the place to be
>searched, and the persons or things to be seized.

The constitution gives you no expectation of privacy when you hold a conversation in "public". RF is public, or at least used to be. Would you hold a private coversation regarding something illegal on a crowded sidewalk and just assume that everyone should mind their own business - even if a cop is standing next to you? Would you order a product by mail and put your credit card number on a return mail post card - knowing that every postal worker that had to read the address would also see the number? Of course you wouldn't - THAT WOULD BE PRETTY STUPID! So if someone is stupid enough to cheat on their taxes or sell drugs by radio, they're stupid enough to get caught. Your idea of a private, protected conversation is rather weak. If the constitution really applied here we would not need laws to fix the problem. The only problem is stupid people.

Correct me if I'm wrong but I think a CTCSS tone board would eliminate
the stuff he DOES want to listen to also. Trunked public service stuff
doesn't use CTCSS as far as I know. Besides, most folks who have to
ask what intermod is probably aren't ready to install a tone board in
their scanner :-) A better solution would be to use an attenuator
which will help intermod *some* or just go out and buy a triple
conversion scanner.

>Other possibilities? Am I on the right track suspecting the
>cordless phone as the culprit in this scenario? - Dave

I had the same problem several years ago with an AT&T cordless, a 3000 series if I remember correctly. The "calls" usually came in late at night (after 11 PM). I called the phone company to see what they thought. "Do you have a cordless phone?" "Why yes!" They said that they receive many complaints (back then) about what they termed "Phanton Ringing" and found it was related to cordless phones doing something. But the service rep could not tell me what caused it.

I ruled out the neighbor theory because the "phantom" rang every phone in the house. Which meant that ring generator signal was on the twisted pair.

I assume now, but never bothered to ask, that the newer switching equipment that checks your line in the middle of the night (the telco brags about doing this) causes the cordless to "act up" sending some type of hook flash, reverse polarity, pepperoni pizza signal back the central office causing ringer to be sent back to the house. Pick up the phone, the ringer is disconnected (as usual), the call is cut through the twilight zone. We did not have a Network Interface Unit (NIU) at the demarc to the house, just a protector. The NIU is what the telco uses when they check things on your line from the CO. If they run tests, perhaps automatically, and you don't have an NIU, the test signals might get to your phone and the resulting phantom.

This was just a theory I had and have never bothered asking anybody at the telco to see if it held any water. In fact I haven't thought about much it in the last few years - but then you brought it up. Where I live now, I have an AT&T 5500 cordless phone, an NIU ant my demarc and I have no trouble with phantom ringing.

I should add that if memory serves me correctly, the problem stopped soon after my inquiry. Perhaps they knew what was causing it and quietly fixed it.

P.S. Feel free to listen in on my cordless phone conversations - it would serve me right.

Jeff, sometimes an article *does* apply to several newsgroups. It's the
"endless followups coming from both groups" that wastes people's money.
If a person chooses to cross-post an article, the "Followup-To" header should
be used to designate one newsgroup. If people don't abide by the headers,
don't blame the original author.

By the way, this article has a "Followup-To" header.

Not to say there is nothing wrong while on the ground, but you must understand that the electronics installed into aircraft (especially commercial jets) are done so in a manner that in most if not all cases will not interfer with each other. Further, you are probably correct in regards to ground operations, but for the record, most aircraft radios (2-way voice) do not have more that about 10W PEP. Even at close range on the ground I doubt that this level could get through the aircraft skin, the radio's metal cover, etc.. to the point of causing much in tha way of problems. Your scanners LO however, is placed nicely inside this big metal waveguide of a fusalage. This could be a real headache to a pilot preflighting his aircraft. Keep in mind, that not all pilots are "radio educated", and may not realize his malfunctioning autopilot is not broken, but being interfered with by your scanner. What does he do?? If he does not know, he will call for maint., and this could cause a delay, or cancellation of a flight.

I am trying not to sound soapboxy, but just use common sense. I as I'm sure a lot of people in this newsgroup am not just a scanner user, but also a amateur radio operator. I also hold a general radio telephone operator (formerly FCC 1st Class). I am also fortunate to be able to work in 2-way radio. The radio hobbiest has lately been the target of many peoples anger. From the good old days of having only to worry about bothering your neighbor's TV, to present day electronic home invader.

Next time ask the flight attendant to get the captains permission to use your equipment, don't hide it and use it covertly. If your caught, all you do is make yourself and the rest of us look like inconsiderate idiots.

Again,
Use Common Sense.

>

If ALL your phones are ringing, not just the cordless, you can pretty much rule out the possibility that it it the cordless that is causing the problem. It is probably a problem with your phone company's switching equipment or something (the *69 results strengthen that idea).

Your best bet would be to call your phone company and explain the problem to them. If they don't know about it they can't fix it. :->

From: "Gregory yea... you can call me Greg" <gregmason@delphi.com>
Message-ID: <JKyX6xj.gregmason@delphi.com>
Source record: 266768

Hi its me.. the guy who didnt know what he was doing with his PRO46, again.

Sadder yet wiser. It seems that i soldered my 000 jumper onto the back
of annother diode... oops! (hate it when that happens) Well it _looked_
like a solder pad to me. A friend who had done the mod before looked at my
work and complimented me... he said that if id put the diode in the right
place, it'd have been a perfect job... wise guy. :grin:

So... he took the diode off where I soldered it, and put it where it belonged.
The solder pad wasnt a pad at all...it was two little dots of solder on the
pc board... What next!?

We reassembled the scanner, and Viola! Uninterrupted 800mhz coverage with
30Mhz steps... Thanks Ted!

That is the wiser part... now for the sadder part.

After using the scanner for fifteen minutes the thing just stopped.
Cut out.. the lcd display blanked! I thought that the scanner was dead, after
I thumped my chest to restart my heart, I turned the power off, and on again.
Guess what? It blinked back to life as if nothing had happened. It's been
doing this on and off now while in the search mode... sometimes it seems to ha
happen after i hit the arrow key, but other times it seems completely unprovoked
Anyone care to hazzard a guess as to what my ignorance has caused in the
scanner? You guys gotta help me.... Its my wifes radio!

---Thanks Greg

To: ALL
Subject: Military aircraft freqs.

Hi,

For the Military Aircraft Monitors, I've found a great source of freqs.
and it is published by the DOD. You can buy (some..)Defense Mapping
Agency(DMA) Publications and Maps...Just write or call:

NOAA Distribution Branch, N/CG33
National Ocean Service
Riverdale, Maryland 20737-1199

or call: 301-436-6990 or fax 301-436-6829

and if you live or will be in the DC area you can go to:

National Ocean Service/NOAA
Chart Sales Office
6501 Lafayette Avenue
Riverdale, Maryland 20737-1199
301-436-6980

and for those of you in or near Canada:

Canada Map Office
Energy, Mines and Resources of Canada
615 Booth Street
Ottawa, Ontario, K1A OE9
Canada

613-957-8861

I've ordered many DMA maps and some publications and they list many
military frequencies for monitoring.

Later,

John Stone

: is a bit much.

: Geez, it's not as though he were attempting to price-gouge, using
: exclusivity as a reason.

: Get up on the wrong side of the bed today? :-)

It was a case of having recently had the "pleasure" of reading some sh*t about how we can not listen to cellular and cordless because it's against the law. That was THE WORST reason I had ever read. I do it all the time, as does about everyone I know. There is NO reason to obey the crummy piece of paper some idiot in DC signed. It simply infuriated me. It's not like they encoded some digital key (by signing that crummy paper) that prevents scanners from listening in. The scanners still scan those regions, can still be bought, and I know of not ONE person who quit "because it is against the law".

I know - no "law" will stop me.

Anyhow, this advertisement comes in suggesting because of FCC rules its a take it while you can deal. Big deal! So what! Atlantic (address and phone number in any recent issue of Monitoring Times with money back guarantee in print if it does not arrive!) and Javiation are still shipping them (Javiation's address, e-mail, snail, phone numbers are elsewhere here too), so who gives a hoot for the fcc regs, as in the other so-called law, no-one obeys them either, they are a bunch of overpaid, underworked, sleazy lowlifes who think the law means everything and gives definition to private.

So, when someone suggests they are selling something you can not buy new, I simply do not buy that! I don't need these "get it while you can" ads, I see enough of them in the US domestic advertising in the mags (US dealers who can no longer compete with the international dealers because the FCC and crummy government decided to handicap them!)

I have a PRO-43 but no experience with the PRO-62. A buddy
has both a PRO-43 and PRO-62 and says they are very similar
in sensitivity, but he hears less intermod on the PRO-62 and
finds its display easier to read.

Recall that the PRO-43 includes military air frequencies
and the PRO-62 does not. Also, the upper freq limit of
the PRO-43 is 999.9875 MHz but PRO-62 won't tune quite that high.

In North America, cellular channels are allocated at 30 KHz increments.
However, the instruction manual for a scanner designed to be sold in
another part of the world (hint, hint) may read differently.

Chances are very good that if you start to encrypt all your transactions this will attract attention to yourself and the government will make you one of the 5,000,000 + Americans that were wire tapped in 1993 (these are Dept. of Justice figures).

>Would you please post the reference to the specific FAR?

[nutshell]
Part 91.21 regarding electronic devices. Specifically exempts hearing aid,
pacemakers. Makes no mention of when you can use them (takeoff, cruise,
landing). Prohibits the use of any device that could cause interference -
interpreted that the operator (airline / pilot in command) is responsible for
making sure that no device is used that could interfere with aircraft systems.

I don't have my FAR/AIM at work but I could transcribe the paragraphs latter
for your enjoyment.

Well, if the government wants to keep regulating communications like this
we'll have to borrow a phrase (or two) from the NRA:

"When the government outlaws encryption, only
outlaws will have encryption."

The point being that if the government bans all encryption, and all of
us law abiding citizens do what we're told, the snoops will be able to
read all about cake recipies and dog toys and the like. But they won't
read a thing about illegal activites since the criminals will be
breaking the law (imagine that!!) by encrypting their communication. And
since that is the snoops evidence... they won't have any evidence so the
case doesn't get prosecuted and the encryption violation won't get
prosecuted either because they don't want to tip their hand that the
rest of the investigation is still continuing. It seems to me that all
this legislation will accomplish is to piss off most of the public, and
most of the law enforcement but will make the congressrats very happy.

"They can have my encryption key when they pry
it from my cold dead fingers."

This doesn't have anything to do with whether or not you can use your scanner on board an aircraft. That's up to the carrier and ULTIMATELY up to the pilot. So ask.

This does have to do with where to find frequencies to listen to. Most airports (from large metro areas) to the dinky little county airport have some sort of general aviation hangars. At larger airports this will be in the form of a Flight Service Station. Smaller airports with only general aviation (ie small private planes) may just have an office or a a flight school. Either way, you can go in and purchase (or maybe just look at) sectional and navigational charts. These 'maps' are covered with approach, departure, traffic, weather, communication, etc. frequencies. For every airport or Traffic contorl area. I think it would be a great source of frequencies... I'm surprised nobody else has mentioned it (or put it in the FAQ).

hope someone finds this useful.

Message-ID: <38j82d$3tm@news.nd.edu>
Source record: 266590
Cross-posted to: rec.railroad,rec.radio.scanner

Over the past week and a half, I've noticed that there have been changes in the radio operations of the Grand Trunk Western around here. It's really minute, but it's enough to pique my curiosity. Previously, when a train would want to talk to the GTW dispatcher, you would hear paging tones. Usually a high tone, followed by a lower tone (was this the repeater answering the first tone?). After a few seconds, the dispatcher would talk. The beginning and ending of the dispatcher's message were punctuated with DTMFesque tones. Instead, the paging tone is two, short, monotone beeps. The "answer" is one longer beep of the same tone. The dispatcher's messages no longer exhibit the tones. Now I hear only a short clicking sound, much like that of the Conrail Chicago East dispatcher's messages. Can a railroad radio expert clue me in on what all of this means?

: provided law enforcement access to *all* encrypted
: communications.

Here is what I want to know. How can one encrypt voice real
time over a telephone line without equipment that costs more than the
average private citizen can afford. I have thought of a few ideas using
a soundblaster card and some kind of encryption algoriothm, but I know
nothing about encrytion. (I do know however that we should be allowed to
keep private what is private to us.... regardless of how trivial it may
be to others.)
I don't believe that my phone calls are very private as it is
now. I have pretty good reason to believe that they arew easily tapped
by business, govt, or just nosy bastards wanting to hear me order over
the phone with my credit card number of hear my converstions with my
(annoying) x-girlfriend. Regardless of WHY a person wants to encrypt
their private (notice the word private) dealings, they should be allowed
to. One's effort to keep their private dealings private in NO way
infringes on ANYONE elses right to the same.
I wouldn't put any real amount of money into any encryption
personally, but I strongly believe that if I wanted to do so, I should be
so allowed. As a matter of fact I believe that there whouldn't even be
anyu question about it. If it were easily done, I would encrypt even the
most trivial of things just to make the point that I can to anyone who
would snoop.
I still wonder... what is available, and at what dollar amount?

As Michael said, the steps are 30 KHz. Your 1500 will pick up every 5th frequency exactly. The other four will be off frequency several KHz but you may be able to hear most of these too depending on how selective the receiver is.

Probably a solder flake somewhere from the mod work. Or, did you remember to use anti static measures? A zapped part will act like this until it finally dies. Another possibility is a weak solder joint on something that you may have desoldered/resoldered, a damaged etch, etc. Also, it could be a loose connection of something you didn't plug back in well.

You are quite right. My apologies. I was referring to Lithium Hydride
cells. They are not rechargeable, so can't really be compared to any
Ni cells. That is why their price/performance is generally related to
alkalines.

Sorry for the confusion

kevwright@cix.compulink.co.uk ("Kevin Wright") asked:
> ... what I may be missing by getting one with the gaps in the coverage?

A European version of the PRO-43 can have the 30-54 MHz range restored by a procedure similar to the standard mod. At the point where the mod says to move diode D4 to D3 (which you already have), you would either remove the diode at D5 or install one at D2 (I don't know which - maybe someone who has done it can chime in).

In the US, the assignments for the gaps are:

88.000 - 108.000 FM Broadcast (200 kHz steps - FMw)
108.000 - 118.000 Aero - navigation

174.000 - 216.000 Broadcast TV chs 7-13 (6 MHz steps - FMw)
216.000 - 218.000 Maritime - AMTS, coast (25 kHz steps)
218.000 - 219.000 IVDS - Interactive Video & Data
219.000 - 220.000 Maritime - AMTS, ship (25 kHz steps)

512.000 - 806.000 Broadcast TV, Chs 21-69

(from the file fcc.allocations on oak.oakland.edu, where you can also find several descriptions of the mod.)

At L450 there is the Yupiteru 7100 and others, but for price/performance the PRO-43 is an excellent receiver.

The emergency traffic frequency for UHF aircraft is 243.000. You may hear radio checks or calls where other frequencies are mentioned on that channel. It is sometimes refered to as "guard".

Pick up a "Haruteq scanner guide" in any Radio Shack. It almost 1 yr. old,
but many freqs are still valid and active. It is yearly edition and I'd
expect a new release will be out shortly. There a zillions frequencies
out there, so the book is the best to have.

I have to clear some things (wife's orders). Will sell
the above collectors item to someone who is truly
interested in Scanner memorabilia. It is working
perfectly and is in good condition (only thing needed
is to solder a small pin on the board, but this is not
a necessity). It comes with the manual, servicing instructions,
and all schematics. Included in the package are 47 assorted
crystals, all checked out and working. I also have 6 pairs
(6 receive and 6 transmit) crystals for CB. Make me an
offer (buyer pays shipping). Offers will be accepted
for the scanner and scanner crystals, the CB crystals, or
both.

But if this device was sold as a "kit", where the purchaser had to put
it together to build a device that may be illegal, would this clear the
retailer of any wrongdoing? After all, they would just be selling a
bunch of components, where the purchaser was the one that created the
device.

Here's a good thing for all you non-technical people. If you have a scnner with the 868-896Mhz range blocked, you can still pick up cell freqs! Cellular One does not use those freqs! Those are reserved for mostly Ma-Bell and affiliates. For example, southwst bell, us west, etc... So just search the areas around the blocked freqs and you should be good to go!

cmo> Does anyone have specifics, like who put it together, how it works,
cmo> frequencies, etc?

This system is a Ku band satellite system operated by Pennsylvania Emergency Management Agency (PEMA) in Harrisburg.

The system permits voice contact to most county EMA and/or E911 centers during emergencies when traditional routes fail due to damage.

The data includes the NOAA Weather Wire for information on severe wx conditions which may effect the area of the receiver.

4 Data Circuits & 1 Video Circuit exist.

Not really monitorable as the voice circuit is all digital.

Can someone help me-I'm fairly new to scanning...my question
is this: When listening in on police frequencies (e.g., CHP), why
is it that I can hear only the base station output and not the
mobile? I can pick up the CHP base freqs at around 42 Mhz--
anyone know how to pick up the corresponding incoming mobile
freqs? Someone had mentioned something about the mobiles using
repeaters--how does this relate to my question, if at all?
Any help on this would be greatly appreciated...

BTW, I just got my PRO-43, and have no regrets buying it,
even though I'm heavily in debt...I've actually spent more
time listening in with my scanner than I have spent at my
PC since I bought it!!

:Everyone always says ONE PERSON can't make a difference... now you all
:say I am making a difference... so... WHY don't you all go out and
:make a difference....

Glenn, I never said one person can't make a difference. We both apparently agree with that. As far as the law goes, you don't have precedent with out one person being brought up on charges (like listening to cordless phones)...then you can charge everyone with it and use U.S. vs Smith ruling to support the charge. So one person CAN make a difference. What difference were you trying to make when you called the White House? What information would you have gotten from Wendy that you didn't get from the person you talked to?

If my post seems combative or argumentative, I apologize. I have read your magazine and listened to your show (even talked to you and Will on it), and I DO respect what you are trying to accomplish on the whole. But that doesn't mean that I can't be confused by or disagree with your actions in this case...

Also, if you were directing the comment about "why don't you make a difference" to me, I would have to ask what evidence do you have that I DON'T make a difference (or at least try to).Making a statement like that is akin to name-calling.
Dave

> scanners allowed on British Airways flights?

Owning scanners is legal. Using them outside the broadcast and ham bands
is illegal. If you don't make a song and dance about it, nobody will care
much what you listen to. If you do get your collar felt, play dumb, be very
polite and appologise for not understanding their quaint ways. They'll wag
their finger at you and send you on your way. The British reaction to this
is to sprint away, punching the air and crying YESSSSS !!! Try to contain
yourself until you're out of sight and earshot :)

Firing up your scanner, mid-flight, is what I'd call pushing your luck.

Ian.

Gary,
I don't have any book titles for you, but you might give these
frequencies a listen to start with:

Seattle Approach (Mc Chord AFB, WA): 126.5 391.9
Mc Chord Tower 124.8 259.3, 236.6
Mc Chord Ground 121.65 275.8
Mc Chord ATIS 109.6 270.1
Mc Chord Pilot to Dispatch 372.2
Mc Chord (AMC) Command Post 130.65 349.4
Mc Chord METRO (Weather) 342.5

I hope this gets you started.

73 and good listening.

: >Meanwhile Congress is sitting on legislation that would ban scanners all
: >together.

: Do you seriously think the ECPA and subsequent ban on cellular-capable
: scanners would have come about if the scannists (as you call them) hadn't
: made so much noise about listening to cellular conversations? Conventional
: mobile telephones were around for a long time before cellular was
: developed and were much easier than cellular to monitor, yet there was
: little talk about monitoring them and never any talk of outlawing
: monitoring back then.

: There is a world of difference between knowing that someone could be
: listening and knowing that everyone _is_ listening (and willing to
: blab whatever they hear). When I walk down the street, I know that
: someone could be videotaping my every move; but my sense of privacy
: doesn't really feel threatened by that knowledge. In contrast, if
: Bill Clinton walks down the street, he knows that his every move _is_
: being recorded, and will likely appear on the 6:00 news.

: Years ago, the monitoring community seemed to realize that transmission
: of private business on the public airwaves was a necessity for many,
: and generally had the good sense to keep quiet about what was heard.
: Now that encryption is readily available, we seem to think that everyone
: who does not encrypt their transmissions deserves to be made into a
: public spectacle. Forcing everyone to encrypt seems to be our mission
: now; we've shown that we can't be trusted to use our good sense in
: dealing with what we hear.

: I suppose in this day and age, encryption really is in everyone's best
: interest. Privacy is something which people should be concerned with
: today. Looking at it this way, our mission (and Glen Roberts' mission)
: becomes a noble cause. Hopefully, we'll be able to find some other way
: to occupy our time once we succeed.

If we are delighted with what we hear on a scanner... shouldn't EVERYONE
listen in... or is only exciting because only one in twenty has a scanner
and probably only 1 in 20 of those... listen to our "good stuff?"

Isn't keeping scanning hush hush... actually making us "better" than "them,"
because we "know" and they "don't?"

I am concerned that those that think the right way to combat this
new attack on our personal liberties is to encrypt everything may
actually hasten the introduction of such despised legislation.

If you recall in the earlier Edwards/Leahy draft of the Digital Telephony
Bill, there was a provision for the government to log the number of
times uncrackable encrypted comms were discovered in the process
of executing wiretaps.

It is clear they want to build a case that the use of crypto is widespread,
is interfering with their ability to execute wiretaps (both legal and
illegal ones), and consititutes a public nuisance.

I fear that a sudden increase in the amount of encrypted traffic simply
plays into their hands.

One thing is clear: the current FBI director is unconcerned with
protecting the assumed rights the public has to be secure in their homes
and papers.

4429. Exploring the Internet (QST)

Newsgroup: rec.radio.scanner
Date: 1994-10-26 18:28:12 UTC
From: scotte@ccs.neu.edu
Message-ID: <38m73s$jut@narnia.ccs.neu.edu>
Source record: 266638
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.digital.misc,rec.radio.scanner,rec.radio.shortwave

Greetings!

I have written a published article in the ham radio magazine QST
(published by the American Radio Relay League) on ham radio and the
Internet. The whole series is called "Exploring The Internet-Part x"
where 'x' is one of the parts shown below:

Part 1 (written by Steve Ford, my editor) specifically discusses what the
Internet is. This was in the September 1994 issue.

Part 2 (also written by Steve ford) describes what the ARRL has to offer.
This was in the October 1994 issue.

Parts 3 and 4 (both written by me, Scott Ehrlich) discuss some of the
TCP/IP commands which can be used, with an emphasis on accessing ham radio
information.
Part 3 is in the November 1994 issue (just coming out now), and part 4
will be in the upcoming December 1994 issue.

If you miss the series, don't have access to QST, or simply want
reprints, here is the information (provided by Steve Ford):

Article copies are $3 per article. The contact person is:

Bridget DiCosimo
Technical Department Secretary
ARRL
225 Main St
Newington, CT 06111

4430. Radio Shack Repacks

Newsgroup: rec.radio.scanner
Date: 1994-10-26 18:28:55 UTC
From: jim@ttech.com
Message-ID: <jim-261094102855@jimsmac.ttech.com>
Source record: 266644

It is not only radio shack that re-packs used returned equipment and sells it as new equipment. I recently purchased a $2000.00 piece of audio equipment. My first clue was a box that looked like it had been through WW2. The equipment was scratched and in poor condition. I returned the equipment immeditally. I am an electronic design engineer and am aware of this practice being performed by at least 90 percent of electronic equipment vendors in both industrial and commercial markets. Please excure spelling... this was typed in <20 seconds.

4431. PRO-43 Low Audio, need help

Newsgroup: rec.radio.scanner
Date: 1994-10-26 18:41:28 UTC
From: jim@ttech.com
Message-ID: <jim-261094104128@jimsmac.ttech.com>
Source record: 266643

I recently purchased the last two modifiable PRO-43's from the local Rat Shack. Both of them perform quite well and the sensitivity of both units is the same. Here is the problem:

One of the units has lower audio than the other. On this unit, it is necessary to increase the volume level approximatley 25 percent more than on the other unit to obtain the same volume level. This also decreases the signal to noise ratio. Is there a way to adjust the FM demodulator? This problem does not occur when receiving AM aircraft transmissions... so therefore it is FM related.

Please e-mail me.

thanks,

+-Jim

Glenn, have you found out what the setup with that is yet? I was under
the impression that they usually had a red phone and a green phone
right next to each other. The GREEN would be encrypted. If that color
scheme is widely used, some one like Carter would only have to know the
difference between GREEN and RED to know whether or not he is using a
secure line. If it is NOT widely used, I would be interested in finding
out why...
By the way, I notice you have WWCR at 5,065 kHz...when did it switch from
5810 kHz? Did that transmitter get blown up, or is it a seasonal change?

Dave

4434. Cellular Antenna / Scanner Antenna

Newsgroup: rec.radio.scanner
Date: 1994-10-26 19:40:50 UTC
From: domonkos@access.digex.net
Message-ID: <4zghkiubGsa6066yn@access.digex.net>
Source record: 266654

Using mobile scanners here are legal, but wanting to keep a low profile
I bought a thru-the-window scanner antenna. I was quite disappointed with
the performance and ended up getting the GRE Super Amplifier which helped
quite a bit. Wanting better 800Mhz performance, I 'borrowed' my wife's
cellular mag-mount antenna and used a TNC/BNC adapter for the scanner.
I was amazed at the significant improvement on ALL the bands, even 30-50Mhz.
Especially important, VHF-900Mhz performance was outstanding! The antenna is
already resonant in the 800Mhz cellular band so needless to say, you get
a significant gain there.

I purchased my own cellular mag-mount antenna from RS and am very pleased
with it. I think this would make a very good choice for mobile scanner
operations while at the same time keeping an inconspicuous antenna on the
car.

Andy

4435. Cellphone signals on 862.1875 and 867.2625?

>US politics have no bearing on shortwave bcsts, Richard. Would you
>please keep your political ads/opinions for the so designated
>newsgroups? At least 30% of the articles lately have no shortwave
>content; most of these are followups to articles you've originated,
>including the cell phone scam (should have only gone to .scanner),
>computer encryption (maybe comp.security), your hit list (politics.xxx)
>something about cordless phones (.scanner) - none of these concerned
>long distance communications below 30 MHz.

Jeff,
You are entitled to your opinion and I am entitled to mine. I say it
has a direct bearing on shortwave radio, scanners, and availibility
of equipment in general. If the current path in washington regarding
further encroachments in our liberties is allowed to continue
unchecked, there will be no radio listening. This is why my feeling
is that this unpleasant information needs to be disseminated to
as wide of an audience as possible. I feel I am doing this with the
best interests of the radio hobbyists in mind. I would prefer to
not feel that I have to do this, but cannot ignore the wholesale
assault on our liberties that persist. If you could see the many tens
of letters I receive encouraging me to continue, you would understand
better my position. Furthermore you appear to be somewhat isolated
in your request. I do not see a clamoring of others supporting your
position, rather I mostly see posts building on the threads I have
started.

Your posts asking for refraining from such postings have little value
to the shortwave world as you claim my postings do. I have not asked you
to refrain from your requests. Rather I feel that all are entitled to
speak their mind. If I do not want to read them, I skip over them.
Despite the fact that I think your requests are short-sighted and have
no informational content in them, I do not and will not use kill
files, as I recognize that everyone has something worth hearing
from time to time and I have found some of your posts interesting
and useful.

In short, I have no intention of honoring your request.

I suspect that you just like to control what others see/hear/read.
If this is true, you would be well advised to run for an office in
the congress as that is what these people do professionally.

The good news it that once November 8 passes, there will be a sharp dropoff
in my postings in this area. Of course if the Lame Duck session our President
has proposed for after the elections comes to pass and produce additional
unreasonable bills, you can bet this loyal soldier will be telling it
as it is so as to rally the net to taking appropriate action.

If you currently own a cell phone and subscribe to a service (like GTE, CellularOne, AirTouch, etc) is it legal to clone another cell phone for your own use. For example, I may want a car phone permanently mounted in my car and also have a pocket cell phone with the same phone number for use when I'm not in my car. I see nothing wrong with this but maybe the feds do ??

I suggest that the one-issue voter is quite bad enough, and this is worse:
The zero-issue voter.

Oh well, it sure must make the decision process easier.

These are the 1.5V lithium AA cells I occasionally see on the racks?

Are these available in anything besides AA? I have a use for them in "C"
size. Also, what does the voltage over discharge time curve look like? Is
it relatively flat like NiCad?

(Who wishes there was an option for running his laptop off of alkalines. I'd
much rather just buy a set of alkalines at one end of a flight and recycle them

at the other, than have to carry three or four rechargeable packs. I mean, with the flight costing hundreds of dollars, another $10 for worry-free battery power isn't that big a deal. Alas, the above commments re alkaline's suitability for very high drain applications are quite accurate, and laptops have drains in the 1 amp and up range...)

I've stayed out of this until now:

As a longtime owner of guns, cars, and scanners, all of which
have been repressed over recent decades, I have to say that you,
Mr. 1 in 250,000,000, are the single biggest contributor I've
seen towards fueling further repression. There was no GOOD
reason for you to call the white house over what you heard.

All it did was rub their noses in another thing they need
to repress.

Thanks for nothing pal.

FREQUECIES FOR NORTH-CENTRAL PA

Greetings from Canada's capital, in the Great White North at
Ottawa. Regarding your report of fighters in your area, they may
have been F-16's based at Andrews AFB with the DC Air National
Guard. You may have got lucky and stumbled on a tactical
frequency. Here are some UHF and VHF frequencies that may turn up
more military aircraft in your area: The Kiowa Military Operating
Area is located a few miles SW of Ravine, co-located with R-5802.
Listen on 237.2 or 232.7 for National Guard helos calling Balky.
You may be able to pick up aircraft in the Duke MOA east of
Bradford and west of North Fork, stretching south for about 40
miles, depending on terrain and your antenna location. As far as
freqs for this area, we drew a blank.

A few miles south of Ravine is Muir Army Airfield. Listen on 49.95 FM for NG Ops, and 40.9 for flight following. Generic Flight Service for military aircraft is 255.4. Make sure to monitor the VHF FSS freqs for nearby civilian airports, they may be providing service to military flights. Williamsport is on 114.4, 122.1, 122.2, and 122.65. These are also generic freqs common to many smaller airports.

Check out Harrisburg Airport for the PA ANG EC-130's on 395.1. Also listen to Appr/Dep Ctl on 126.45, 379.8, 124.1, 339.3, 118.25 and 247.2. For higher-altitude aircraft, check out NY Center on 118.45 & 319.9, as well as WA Center on 132.525 & 287.9. From time to time you may hear A-10's from the Maryland ANG at Martin State going overhead on their way to Ft. Drum, NY.

Some frequencies that may yield some tanker aircraft (and the receiver aircraft): 276.5, 235.1, 348.9, 282.7, 284.6, 283.9, 306.3, 317.4, 363.1, 288.3. Cleveland Center may hold some listening on 126.425, 338.3; there are plenty more, again depending on your location and antenna. Keep listening. You may be surprised at how much is actually out there. Cheers.

Cheers,

>illegal ones), and consititutes a public nuisance.

Actually, the provision in the Edards/Leahy Draft was there for
just the opposite reason.

This provision was offered by a House Staffer who really *hated* clipper.
He offered that provision with the belief it would reveal that
very few wiretaps revealed uncrackable encryption -- providing
further evidence against a need for gvt. escrowed encryption
schemes (read Clipper).

It was left out of the final bill because the staffer changed his
mind after he became concerned that the FBI would keep the results
of the logs classified and, no matter what they actually showed, would say
that there was a lot of unbreakable crypto interfering with
their ability to wiretap. He did not want that provision to become an
excuse for imposing an escrowed encryption standard.

Thought some of you'd find that interesting.

No, Henry; the Renewals are specially-designed manganese alkaline cells.
They a slight bit of capacity compared to "regular" alkalines in return
for very little gas generation during recharging.

All this sounds like good ole mama and papa government
sticking its nose where it doesn't belong. Namely, interfering
with good old free enterprise. I do not see anything wrong
with offering a good price for a phone in a package deal.
If someone doesn't like it, WHO CARES, he can go somewhere
else to do businees. That whats great about free enterprise. I
try to attract you as a customer and you are free to choose
who you do business with. The fact that there is a law against
this practice is surprising. Not as much so when you realize
that the law was inacted in California.

When government has completely regulated all businesses, guess
who will be next. Look out behind you it may be YOU.

All keeping the information to yourself does is:
1) prevents you from violating the law which prohibits disclosure
2) prevents the "target" from being aware that information is
being intercepted, which keeps the faucet turned on so to
speak.
3) prevents the "target" from being publically embarrassed and
therefore forces them to try to do something about it.

There are obviously lots of reasons not mentioned above, but you get the
general flavor.

First, that would by copyright infringment. Second, I want people to
actually read the article in the magazine or as a reprint. There are
some nice examples and sidebars you would be missing if it were posted here.

Neither I nor anyone else can stop someone from doing this, but I
certainly won't.

Believe me. The series is worth reading in the magazine or in reprint form.
The responses I've already received have proven that point.

73,
Scott

You want to keep scanning, totin' guns, and carrying on in whatever fashion the Constitution says you can, then you gotta be willing to stand up and fight. The fact is, too many people ought there want to take away our individual rights and if we sit back and do nothing, they'll just have an easier time of it. As far as I'm concerned, the ariwaves are mine, especially those that come into my house. This is not about being a peeping Tom, peering through the window slats as Lady Godiva rides down the street. This is about Lady Godiva parading around in by yard, coming uninvited into my house, sitting down butt naked on my couch and coyly saying, "Don't look at me." The issue is that we ought to have the right to listen to anything and everything. If you don't want to be overheard, whisper, encrypt or don't say anything you don't want to see in tomorrow's paper. We need to stick up for our rights and that unfortunately requires talking about what it is that we want to do.

ptiming@sunyboard.org says:

" Sheez, what a bunch of inconsiderate, stuck up losers you guys are...

" Did it ever occur to you that some of us might not have ACCESS to rec.radio
" .scanner?????????

Sorry, PT. The point has been made ad nauseum...
The main criticism has been that they're (whine) just too busy to read both groups so they (the net cop geeks) want to remove your ability to get scanner related info.

These folks are probably very disturbed by the gov'ts action to limit the ability of people to listen to specific blocks of frequencies but they want to restrict *your* access to scanner related info by coercing people to abandon a perfectly useful newsgroup. Seems bit inconsistent doesn't it. However, logic sometimes is just beyond the grasp of some individuals.

It's seems that the concern over excessive use of bandwidth might be a point of discussion *IF* you're a site manager. As a net user (and a newbie at that...) the people who advocate the abandonment of Alt.Radio.Scanner show a considerable lack of understanding about the politics of a freedom of choice regarding newsgroups.

The ultimate control of newgroup use rests with the readers of the groups, not with the posters. If you wish to unsubscribe to a group please feel free to to so. Other than that, please - BUZZ OFF!

Or, maybe you're just a politician in training. Testing your ability to make decisions for others.

Anyway, PT. I second your salutation with a hearty SHEESH!

regards;

Hi,

I was wondering if there is a FAQ for any of the *radio* newsgroups.
I'm really interested in learning about HAM and radio stuff. Are there
any good books around for that ? Can anyone please give me a brief
introduction to this entire concept ? :-) Thanks for trying.

Kee

Printing the exact working of the cordless ban would be useless, since it consists almost entirely of phrases like "remove the words following dah dah dah dah in Title XX Section XXXX, and replace them with blah blah blah".

I figure the easiest way to handle it is just pull out the appropriate sections of the ECPA, and then go through them with a word processor and make the changes that are forced by the digital wiretap act. The only thing I'm waiting for before I do this is for Slick Willie to sign the damned bill. Since he has yet to sign it, technically there is no cordless ban at the present time.

: One thing they can do and most likely will do is to ban the type certification
: of equipment that is capable of being used to break the law. This is
: what the 1992 scanner ban was about.

... and there has not been ONE none-FCC type accepted scanner prevented from entering the US from foreign ports. It is legal to import for purpose of storage and possession, but not to use it unless you take it outside of the US and it's territories. This is why the US Customs will not prevent their arrival. There are other exceptions, one of the most notable is that some companies say "for industrial/commercial applications". Guess what, with a business like sounding name in the right area (such as cell-tel service inc) they will sell you whatever you want "thinking" you are an authorised buyer. Just have it shipped COD to avoid a credit check delay and pay with a money order. Works great! I think EEB or someone was offering this option quite recently.

In any event, I can walk through the loopholes they left in the import ban, they are that big, and if they sew them up, they would not be able to buy any themselves! Not to mention, its no biggie to get one from Canada to the US across the border, since there is the NAFTA thingy, they are much less concerned of what a person is carrying in terms of personal stuff. As long as the drug doggie does not wag for you, you're clean... they have not yet trained the drug doggies to sniff for cellular/cordless capable scanners! :)

>an almost across-the-board stricture against using anything, passive or
>active, during take-off and landings, but that's it. Sorry for the
>vitriol, Tom, I feel better now.

Regarding "bullshit": Please refer to the following Federal Aviation Regulation. Part 91.21.

(a) Except as provided by paragraph (b) of this section, no person may operate, nor may any operator or pilot-in-command of an aircraft allow the operation of, any portable electronic device on any of the following U.S.-registered aircraft:
(1) Aircraft operated by the holder of an air carrier operating certificate or operating certificate; or
(2) Any other aircraft while it is operated under IFR.
(b) Paragraph (a) does not apply to-
(1) Portable voice recorders;
(2) Hearing aids
(3) Heart pacemakers
(4) Electric shavers
(5) Any other portable device that the operator of the aircraft has determined will not cause interference with the navigation or communication systems of the aircraft on which it is to be used.
(c) In the case of an aircraft operated by a holder of an air carrier operating certificate or an operating certificate, the dtermination of required by paragraph (b)(5) of this section shall be made by the operator of the aircraft on which the particular device is to be used. In the case of other aircraft, the determination may be made by the pilot-in-command or other

operator of the aircraft.

There you have it. The airlines, by regulation, determine what kind of portable electronics can be used on their airliners. They are responsible for the safe operation of their aircraft. Note that the airline company is the "holder of an air carrier operating certificate". Scanners are expressly forbidden under 91.21(a) unless the airline has DETERMINED that it is not a problem and falls under 91.21(b)(5). Paragraph (c) makes THEM RESPONSIBLE for the determination. It's not a pilot-in-command call to make scanner exceptions on an airliner if the company has already said no to scanners.

There is no definition of "passive" or "active". For the purposes of harmful interference, any electronic device can have emmissions (receivers have measurable emmissions - some more than others.)

For those of you not familiar with some other related rules and regs:

Amateur radio operation on board an aircraft is restricted by FCC Rule 97.11 and FAR 91.21 (above).

Cellular telephones may NOT be used on board an aircraft while airborne per FCC Rule 22.913. While on the ground their use is subject to FAA regulations and other applicable FCC rules.

You might want to file this one for the next time you fly or someone askes you about taking a scanner on a plane.

Now sit back, relax, and enjoy your flight.

>NO, the One Person Can't Make a Different is attribution to the common bitch
>people have with the political system in this country... also expressed as
>"you can't fight city hall and win."

True. But if these same people would bitch about the way their government
is run (city, state and federal), things would change. When was the last
time some person in the government pi**ed you off? When was the last time
some government action, law or policy pi**ed you off?

What did YOU do? Did you vote against this person in the next election?
Did you take time to write and express your disapproval or let them know
your ideas on the matter?

If enough "One Persons" tried these SIMPLE things (instead of just bitching)
something just might change.

I always thought that the USA was supposed to be government BY the people -
NOT government AGAINST the people! WE the people must blame ourselves for
the mess we are in.

: >
: >Isn't keeping scanning hush hush... actually making us "better" than "them,"
: >because we "know" and they "don't?"

: All keeping the information to yourself does is:
: 1) prevents you from violating the law which prohibits disclosure
: 2) prevents the "target" from being aware that information is
: being intercepted, which keeps the faucet turned on so to
: speak.
: 3) prevents the "target" from being publically embarrassed and
: therefore forces them to try to do something about it.

: There are obviously lots of reasons not mentioned above, but you get the
: general flavor.

That wasn't my point. If we like listening to stuff on a scanner, we
should encourage EVERYONE else to do the same. But someone, we feel
special, because we hear stuff others don't. We feel special, better,
than everyone else. So, we better not let anyone else know what we
can hear, cause then the fun might go away.

Everyone is acting like it's a big secret... but its not.

: : Washington, DC -- If private encryption schemes interfere with
: : the FBI's ability to wiretap, they could be outlawed, according
: : to recent comments made by the agency's Director Louis Freeh.
: :

I'd like to suggest a good cryptography reference (sorry if this has been posted already)...
Applied Cryptography, Bruce Schneier, ISBN 0-471-59756-2, John Wily & sons

The forward gives a nice history of encryption and how it's been suppressed until recent years, gives descriptions of cryptographic protocols for everything from playing poker to electronic money, and gives explanations and source code for many publicly known encryption algorithms (including RSA and DES) as well as discussion of which have been broken, and the likelyhood of particular encryption methods being broken by brute force attack over the next few million years.

Outlawing cryptography will be pretty darn difficult considering that the knowledge is available to the public legally today, DES or any other algorithm can be strengthened with longer keys to the point that the NSA could never crack them (as far as any cryptographic researchers know), and the main reason why it would be difficult to outlaw is... large corporations depend on cryptography for secure electronic banking, discussing trade secrets, etc., and it will be a major part of the whole darn Global Economy.

As always, any programmers awesome at any Assembly and C, please read my .sig.

Kevin,

Keep it! Dollar for dollar there is not a better handheld scanner
out there. You can pay more for wider freq coverage and a few more bells
and whistles, but this one is a good choice. It is stabel and relatively
immune to overload and images. I've a few others, but this is my regular
standby handheld. Get something more exotic as your second scanner. This
one will do very nicely as a day to day rig. Very dependable.

You will find a text copy of the manual I wrote on in the
Hamnet Scanning Library on CompuServe.
I don't think its anywhere on the Internet though.

If anybody wants it I'll put it on my local FTP server - let me
know.

Hard copies are also available :-)

4479. SmartZone trunking?

Newsgroup: rec.radio.scanner
Date: 1994-10-27 11:11:12 UTC
From: an84802@anon.penet.fi
Message-ID: <111316Z27101994@anon.penet.fi>
Source record: 266530

Hello All
I wonder if anyone reading this can help me? I have just read
in a British PMR trade magazine that London's Metropolitan Police have
chosen Motorola's SmartZone trunking system to replace their current
25 year old system of VHF repeaters. The magazine doesn't say much
about SmartZone only that it is an analogue system proprietory to
Motorola.

Does anyone out there know anything more about SmartZone?
i.e Is it a system which changes frequency every time the PTT button
is pressed or does it stay on one frequency during a conversation?

Is SmartZone used anywhere in the USA or is this the first
installation of such a system?

Thanks for your time.

Ony "real things" you are missing is Wide FM Radio & TV Sound.

You can mod the radio to cover 29-54MHz at the bottom end but its
not really worth doing over here and the RF section is not "tweaked"
for that part of the spectrum but it will work.

Depending on what you want to listen to you might find that the
default increment steps do not allow you to enter the exact
correct frequency. For example in say the 152MHz band we use
12.5KHz channel spacing but the PRO-43 defaults to 5KHz. If you
tried to enter 152.3375 which is used locally to me it would store
it as 152.335 - not the end of the world though.

> The searching through freqs, also does not seem that fast compared to an
> AR2000 that I played with a while back.

You can speed it up with an internal mod but I don't know how
effective it is.

4483. PRO-43 Modifications

Newsgroup: rec.radio.scanner
Date: 1994-10-27 11:58:33 UTC
From: 5609946@sscl.uwo.ca
Message-ID: <5609946.38.000BFA27@sscl.uwo.ca>
Source record: 266568

Does anyone have a complete list of modifications possible? I am familiar with the most common one, that is, restoration of cellular freqs, but I have heard of others, including the possibility of receiving 400 channels, uploading freqs. via a computer, etc.

Also, if one was going to increase the range of the scanner via a better aerial/anntenna, what would be a good generic one to try (i.e. something that I could pick up at Radio Shack or somewhere common).

Thanks in advance!

5609946@sscl.uwo.ca

4484. Frequency Counters

Newsgroup: rec.radio.scanner

Message-ID: <5609946.39.000C0293@sscl.uwo.ca>
Source record: 266569

What exactly are frequency counters and how valuable are they for the occasionally scanner user? What could I expect to pay for a half decent one and what could I expect it to do?

As you may have guessed, I know little about them and I would appreciate any input from anyone, especially those that actually own one.

Thanks!

>which way you look at it.
>Mike.S

Oops, you blew it.

PRIVATE conversations are not broadcast in the clear by high power transmitters at high-elevation sites. For pete's sake people, any old-style TV set with UHF channels going up into the 80s can pick up cellular phones! It's really not that tough to stuble across them on extremely commonplace receivers.

We'll keep hammering on it for as long as it takes: If you want privacy, do not shout out your private communications in a crowded place and then haul everyone who happens to be there into court. We will fight you.

These anti-scanner laws go against common sense, period.

Abe,

I do believe that the new FCC rules state that changing the
ESN on a cell phone is against their rules. I say having two phones
on one number is great if you do NOT plan to receive/send very many
calls. Most of the people that I know who have cellphones use them
almost entirely for safety reasons. The only way a cell company can
find out that you have two phones on one number is if calls are placed
from both phones at the same time. All they do is shut your service
off. I would then act computationally changelled any say that someone
must have stolen my number EG cloned my ESN.

PGP only needs to be used to pass the initial keys, from then on, less
processor-intensive algorithms can be used.

One could use the kill file feature? But then, might as well stick one's head into a hole in the ground and pretend the real problem doesn't exist?

I'd rather see Rich's comments, he's trying to incite people to get motivated into changing the system for the better, but then again, some people don't want to change for fear of losing their status...

BTW, I've been keeping track recently, the number of flames against Richard are catching up to his number of posts; who's wasting bandwidth? Perhaps attitudes will change when the govt restricts your use of shortwave.

No personal e-mail responses, please, I'll repost them here anyway...

4494. Wilmington, Mass., Tach 5 freq.

Newsgroup: rec.radio.scanner
Date: 1994-10-27 14:43:16 UTC
From: chris@ll.mit.edu
Message-ID: <1994Oct27.144316.4761@ll.mit.edu>
Source record: 266546

My husband and I live in Wilmington, MA, and for as long as we can remember, Wilmington Police has been using this "tach 5" frequency. We cannot locate the frequency anywhere, and when we inquired with the police, they told us they would not give it out, it was none of our business what was being said on that frequency. They will run plates and such on their main freqs., but anything important, they go to tach 5.

We have checked every book we could think of, and have come up with nothing. We have no idea where to begin to search. They are not on the 800 band, and we don't believe that they would use the 800 band for that freq. alone.

We have had alot of crime in our area. The twenty-six years I've lived in this town, you could leave your doors unlocked at all times. Now, it's a nightly ritual to make sure the windows are closed and locked, the motion detectors lights are on, and the deadbolt is locked. It's sad to see this happening in this town, and we would feel safer if we knew what was going on.

Anyone have any ideas as to where I can get this frequency?

Chris

To OS456 Users:

I recently installed the OptoScan456 computer interface
into a Realistic PRO-2006 scanner. Both the installation
of the interface card and configuration of the accompanying
Scan*Star software (Rev.1 - 4/24/94) went smoothly. All
but one of the software options function as expected.
Signal level scanning does not work. I select the
appropriate options on the Squelch Control Settings menu.
When scanning resumes, the scanner does not lock
onto the frequencies or channels now associated with the
signal level scanning feature. Any suggestions on
correcting this problem are appreciated.

Thanks,
Bill Plymale

I've been getting close to 6 hours using Renewal rechargable alkalines. So
far I like them. They have higher capacity than nicads and I don't have to
worry about them self discharging. That's important so I can leave the scanner sitting
unused for a couple of months and pick it up and it's ready to go.
Also, since they're rechargable, I don't feel that twinge of guilt I sometimes
get when I'm running down my batteries.

I don't understand why you would want one. At least comparing it to my Minitor Pager. Mine sucks. I get a lot of static. I have to reset mine right after it goes off or I'll hear lots of static. I can't keep it on all the time. I guess I hang around a lot of RFI.

Noble cause, yes, but unfortunately to the DC buttheads he will come off
as sand in their shorts and they will only act to suppress the means by which
he got the information. There's a dangerous move in D.C. and single handed
efforts won't have much effect. United as we are here in these conferences
we are but a minority, and the general public views us as 'nerds' or
eavesdroppers, thanks to the maggot media.

Ever want to program a major shortwave station? Pick the kind of shows YOU want to hear?

Well here is your chance!

I have been asked by Adam Locke of WWCR to post the following:

To all WWCR Listeners:

This is your chance to let us know what you want to have more of. For months we have been doing country music to the world in the afternoons. Do you want this to continue, or would you like to have more talk programming during the day? Any favorite talk shows? Other ideas? Mail us a post card with the top five shows youwould like to hear during the day (no phone calls please).

EMAIL US at: NMKS01@PRODIGY.COM

Or write:

WWCR AFTERNOON PROGRAMMING SURVEY
WWCR AVENUE
Nashville TN 37218

Do it TODAY!!

Note: Please spread the word. Can someone post this on rec.video.shortwave and FIDO SW ECHO?

I can not access these conferences. Just repost the message.

I have already said what I would like. Also WWCR will be running their afternoon programming on a new lower frequency, so we can all HEAR it during the afternoon hours.

Corrections: E-Mail address is NMKS01A@prodigy.com
Street address is 1300 WWCR Avenue.

Program director is Adam Lock (no "e" at the end).

4509. Re: Help: can I hear mobile to base?

Newsgroup: rec.radio.scanner
Date: 1994-10-27 19:26:11 UTC
From: fr570@cleveland.Freenet.Edu
Message-ID: <38ousj$j47@usenet.INS.CWRU.Edu>
Source record: 266555

The CHP radio allows the officers and the dispatchers to talk at the same time. In the Police Calls book, look for the nearest CHP office to you and note the frequency. Look at all the other titles for that same frequency; you'll find a color assigned to that frequency. Now look for a title that says the same color with the word mobiles after it; for example "Orange Mobiles". Both of those frequencies need to be in your scanner. Unfortunately, if you have other frequencies in you scan, the conversation will be broken. If I hear an interesting situation, I'll lock out all other channels and make sure "Delay" is off. If the officer wants to talk to another officer, they will go "car-to-car" which is the same frequency you hear dispatch on. It gets frustrating trying to listen to them sometimes.

They are only available in AA size (AAA size may exist someday), but they will never be bigger than AA size because the chemical contect of larger batteries would require that they be shipped as hazardous materials.

4511. Strange (?) reception - PRO34

Newsgroup: rec.radio.scanner
Date: 1994-10-27 19:50:39 UTC
From: carmins@dayton.saic.com
Message-ID: <38p0af$9hu@dayuc.dayton.saic.com>
Source record: 266559

For all of you PRO-fanatics out there, I have a (dumb?) reception question with which you may be able to help:

On my PRO34, I receive what sounds (to me) like an unmodulated carrier, which slowly (very slowly) rises in frequency, starting at approx 150.000MHz, going up to 160.000+ Mhz or so. The change is very gradual; I can listen, for instance, to the Co. Sheriff (155.415), where the carrier will slowly "rise" to the frequency, interfering with the reception of the Sheriff. I can increase the squelch, and this works until the carrier keeps the squelch open (full squelch). Then, the carrier slowly drifts higher, I can reduce the squelch, and everything is ok again - the carrier slowly slides onward up the frequency scale.

I've just started noticing this odd behavior in my PRO34. It does not seem to be a " local" problem. Trips to Cincinnati/N. Kentucky (50+ mi away) show identical "interference".

Am I just a victim of intermod with this single-conversion scanner? Or is my 34 due for replacement?

Smartzone Trunking, is sort of like multiple trunking systems linked together
to cover a large area. The big difference is that a channel assignment does
not necessarily mean that any two mobile are on the same freqency/channel.
Instead, lets say there is a mobile in the northern part of the state or area
on trunking talkgroup 002. This same talkgroup 002 has a mobile in the
southern part of the state or area. When the mobile up north gets a channel
assignment, let say channel 2 of the local system at 859.0125. What the
smartzone controller does is find a free channel for the southern mobile on

say channel 005 at 854.9125. All the smartzone controller knows/cares about is linking members of the same talkgroup together. This gets even cooler in that the two or more mobiles in a talkgroup do not even have to be in the same band. For example: a Federal Government mobile on a UHF portion of a Smartzone system with talkgroup 002 could and would communicate with an 800 Mhz mobile on talkgroup 002 using the 800Mhz portion of the Smartzone system. There are many many possibilities with Smartzone Trunking. Too many to be explained in this forum. A Smartzone system could consist of Smartnet/Simulcast/and Smartzone trunking systems and conventional repeaters too, all under the single control of the Smartzone controller. The possibilities are endless..

And yes there are quite a few in the US Public Safety Arena. The State of Michigan is in the process of converting over to a Statewide Smartzone/Astro Digital Backbone. However, this system will be under construction over the next several years.

Good Luck Following These Conversations :)

They don't listen to them manually, they actually have computers listen
for 'key' words. Anything with 'kill' and 'president' gets some attention
I guess. Soon, any converstaion with 'scanner' will bring armed men to
your door I'm sure.

Dear brothers and sisters, Our esteemed colleague from Hawaii, Mr Jeff Herman, has implored us to take this thread elsewhere. Apparently Mr Herman sees no relevance to the shortwave or scanner hobby. So I guess we should all heed his request. I wonder if I asked the US senate or the US house to take their silly threads to Moscow if they'd do it?

So following the philosophy Soren Ashe espouses, maybe we should emulate the Swedish Royal Family?

: >an almost across-the-board stricture against using anything, passive or
: >active, during take-off and landings, but that's it. Sorry for the
: >vitriol, Tom, I feel better now.

It is amazing how many people think they are exempt from federal regulations. Only to again be suprised when a new tighter law emerges due to their lack of obeying the origional law due to their "personal belief exemption". How many of you idiots are going to make sure that scanning becomes outlawed all together?. Keep up the wonderful uninformed / educated attitude so the government can show cause to lay some more "bullshit" on us due to you and your kind. Pick up a book on electronics, and find out how and why your scanner works, and then you may be qualified to determine what is and is not "passive".

Now read what someone else has posted for your interest, and hope that the list of regulations following don't get any bigger!.

: Regarding "bullshit": Please refer to the following Federal Aviation
: Regulation. Part 91.21.

: (a) Except as provided by paragraph (b) of this section, no person may
: operate, nor may any operator or pilot-in-command of an aircraft allow the
: operation of, any portable electronic device on any of the following
: U.S.-registered aircraft:
: (1) Aircraft operated by the holder of an air carrier operating certificate
: or operating certificate; or
: (2) Any other aircraft while it is operated under IFR.

: (b) Paragraph (a) does not apply to-
: (1) Portable voice recorders;
: (2) Hearing aids
: (3) Heart pacemakers
: (4) Electric shavers
: (5) Any other portable device that the operator of the aircraft has
: determined will not cause interference with the navigation or communication
: systems of the aircraft on which it is to be used.
: (c) In the case of an aircraft operated by a holder of an air carrier
: operating certificate or an operating certificate, the dtermination of
: required by paragraph (b)(5) of this section shall be made by the operator of
: the aircraft on which the particular device is to be used. In the case of
: other aircraft, the determination may be made by the pilot-in-command or other
: operator of the aircraft.
: ----------

: There you have it. The airlines, by regulation, determine what kind of
: portable electronics can be used on their airliners. They are responsible for
: the safe operation of their aircraft. Note that the airline company is the
: "holder of an air carrier operating certificate". Scanners are expressly
: forbidden under 91.21(a) unless the airline has DETERMINED that it is not a
: problem and falls under 91.21(b)(5). Paragraph (c) makes THEM RESPONSIBLE for
: the determination. It's not a pilot-in-command call to make scanner
: exceptions on an airliner if the company has already said no to scanners.

: There is no definition of "passive" or "active". For the purposes of harmful
: interference, any electronic device can have emmissions (receivers have
: measurable emmissions - some more than others.)

: For those of you not familiar with some other related rules and regs:

: Amateur radio operation on board an aircraft is restricted by FCC Rule 97.11
: and FAR 91.21 (above).

: Cellular telephones may NOT be used on board an aircraft while airborne per
: FCC Rule 22.913. While on the ground their use is subject to FAA regulations
: and other applicable FCC rules.

: You might want to file this one for the next time you fly or someone askes you
: about taking a scanner on a plane.

: Now sit back, relax, and enjoy your flight.

Add a Plectron Crystal Controlled Monitor Receiver
to Your Scanner Collection

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of the author.]

In the 1960s and 1970s, thousands of firemen and ambulance squad members came to rely on their transistor Plectron and Motorola monitor receivers. They have now been replaced by portable pagers, and are often available at hamfests in the $5 - $25 range. Since many are in rough condition and need repair, a hamfest special is better suited for hobbyists who like to fix their own radios.

Plectron and Motorola crystal controlled receivers are excellent for dedicated monitoring of local frequencies -- a task for which you wouldn't want to tie up your 400 channel programmable scanner. They can be powered form 117VAC or 12VDC with the proper mobile cord.

The audio quality on a Plectron P1 or 700 series is far better than any consumer grade scanner and the sensitivity and intermod immunity is outstanding if aligned properly. The Plectron 500 series is less desireable. The Motorola Alert monitors are pretty good, although the audio lacks bass.

No single Plectron or Motorola Alert monitor can cover the entire 30-50 MHz band, and there were versions optimized for each portion of the band. There were different "split" models to cover segments of VHF-hi band, too. Although UHF versions were made, they are somewhat rare.

Both brands of receiver require special crystals. I sometimes use Radio Shack's generic 3rd overtone scanner crystals in the Plectrons but they oscillate on frequencies far away from their marked frequencies. That's because the Plectron oscillator is designed to be used with a crystal which oscillates on its fundamental, not overtone, frequency.

I have a few Motorola Alert monitors, 6 Plectrons in my living room, 7 Plectrons down the basement and some stored in reserve. The basement Plectrons are turned on automatically when someone walks down downstairs. Power to them is controlled by modified Radio Shack Safe House infrared motion detector, originally sold as an intrusion alarm.

When a rescue squad member from Missouri advertised a number of Plectrons on USENET, I bought them -- all 20+ of them. I fixed and restored each one, recrystalled them on local frequencies, and distributed them to members of my scanner club who were glad to get them.

If you find the squelch on your Plectron 700 series receiver has too much hysteresis, replace R96, a 180K resistor, with a 560K resistor. On the P1, the resistor is designated R81.

I have not used the Plectron tone alerting features so I cannot address that except to say that the special coils and capacitors for the dual tone decoders vary depending on the tone frequencies and are somewhat difficult to obtain. Parts for Plectron receivers are available from:

Plectron
Plectron Place
P.O. Box 960
Imboden, Arkansas 72434

telephone 1-(501)869-2877

BTW, I currently have no Plectrons for sale. I'm hoarding them. :-)

It's the best we can do at the moment. Yes other ideas are out there, but
have yet to be really developed. "A" key authentication has been spoken of
for a few years, along with using a "KEY" chip that inserts into your
phone. The phone would be a dumb phone until you plug in the chip. the
chip is unique to the phone, so even if a cloner gets your MIN and ESN,
it's digitized and he has no way to decode it(Not yet anyway)... Believe
me, if there were other ways available, I would think our product would be
out to pasture.

>
>That wasn't my point. If we like listening to stuff on a scanner, we
>should encourage EVERYONE else to do the same.

OK, let's say my hobby is fishing and I like it. I should encourage
everyone to go fishing. Suddenly there are swarms and swarms of
fisherpeople all over my quiet little lake with their boomboxes,
screaming kids, speedboats, etc. The relaxing tranquility of the
experience is ruined, and I don't feel like fishing anymore.

Or maybe my hobby is hunting and I encourage *everyone* to go hunting.
The woods are then so chock full of hunters that even in the unlikely
event that I manage to spot some game, I wouldn't be able to shoot at
it for fear of hitting another hunter. [No flames about guns or hunters,
this is just an analogy.]

What if I liked mountain climbing, canoeing, or even golf. I certainly
wouldn't want *everyone* doing these activities or our mountains, rivers
and golfcourses would be so mobbed with every Tom, Dick and Harry that
the activies would be ruined for those who truly appreciated their essence;
and the resources upon which each activity depends would be trashed by
people who did not have any true regard for their preservation.

But I would not hesitate to teach fishing to someone who saw beauty in
the tranquility of the lake, or to teach hunting to someone who identified
with being in the wilderness environment, or to teach mountain climbing to
someone who saw the mountain as a the awesome natural creation that it is,
or to teach golf to someone who valued the relaxed social interaction which
makes the sport popular.

And I would not hesitate to teach scanning to someone who truly appreciated
the wonders of radio waves and the art of communications monitoring. (Yes,
some of us *do* view it as an art.) I would definitely _not_ teach
scanning to some busybody just looking for gossip material, or to some
lawbreaker trying to avert the police, or to some overzealous reporter
wanting a cheap story. In fact, I would not teach scanning to anyone whose
behavior would be detrimental to maintaining access to the signals
travelling within our natural resource - the radio spectrum - upon which
the hobby depends.

Sorry Glen, you and I are on opposite ends of the spectrum on this one.

> never seen another scanner like it, and wonder why it's not standard
> equipment.

The Electra Bearcat BC-300 and BC-350 had the same tape feature as the
BC-250.

You could program an "AUX" bit associated with each memory channel.
The rear terminal strip connections would activate a recorder
if the squelch opened while the scanner was on a channel with the
AUX bit set. Electra used a transistor to do the switching instead
of the relay used in more modern Icom receivers.

The contacts are useful in other applications, like switching on a
descrambler, converter, or transmitter (for repeater operation).

VOX operated cassette recorders are now more popular and today's
average scanner buyer has less need for auxiliary contacts.
I miss them, and the AUX bit facility, too.

Message-ID: <783254656snx@sv.span.com>
Source record: 266434

I am soon to buy a scanner, but before I buy one I'd like to know which one will be good for the purpose. I need to take a discriminator output from it which will be converted to TTL and sent to my PC. What would be very helpful would be if anyone has ever modified their scanner to take an output from it could they please tell me on which machine they did it, and give me a little bit of guidance.

I vaguely know someone who has modified an MVT7000 for this purpose but I can't get in touch with him for some help. It should preferrable be a quite cheap scanner that does 800-1000 aswell please.

Would it be possible with a Pro-43 ? (They're a pretty decent price).

Please e-mail me if possible as I very rarely get a chance to download news these days.

Thanks in advance,
Kelvin.

>unethical any which way you look at it.
>Mike.S

But it's not private, even though many people with cellphones or cordless
phones have been fooled into believing that. That's the whole issue that's
at stake here. If it's got an antenna on it, it *cannot* be private unless
it's encrypted.

Short of having the FBI or FCC travel around in snooper vans, there's no
way to enforce such an idiotic law.

Even my Motorola cellphone manual has a notice in it that the phone transmits
"on radio frequencies" (heh) and they do not guarantee privacy.

Quoting chris from a message in rec.radio.scanner

>We have checked every book we could think of, and have come up with
>nothing. We have no idea where to begin to search.

Chris,
Hunting for a frequency can somtimes be challenging. Here are
some things you can try:

1. Find the local CB/RADIO shop. Often places that sell scanners
sell frequency lists or they will tell you what you want to know.

2. Get POLICE CALL for your area and see what police frequencies
are licensed in the area. Maybe TACH 5 is a mutual aid channel.

3. Scan repeater inputs for pairs not in use. A PD near me had
a bunch of 5 watt handhelds on a repeatr input channel. They
used simplex. Most people scan the outputs and don't even think
of the inputs. If the officers are close to you scan every
input through a range. Add the up split value and listen there
to see if you can hear any activity.

The police like to think frequencies are "secret" but with
some active listening and checking of signal strengths it
really doesn't take that long! Good luck.

Just thought I would fill everyone in on some important points in the ongoing battle over waste of bandwidth:

1 - Your assuming everyone who reads this newsgroup is concerned with what the U.S. government is doing to regulate scanner use. There is more to the universe than the U.S.

I live in CANADA, and don't give a sh*t about what your government is doing to limit your scanning abilities. If your so concerned with how Clinton is infringing on your rights, then I'm sure you can find an acre or two of Canadian soil to park your self down on.

2 - If you all spent as much time writing to your respective representatives, as you spend bitchin' at each other here, I'm sure you would get something done.

3 - If everyone wants somewhere to discuss the politics of the hobby, then lets create a new newsgroup. Possibly Rec.radio.politics, then anyone who didn't give a damn (like me), wouldn't waste their time skipping over them. And all you wanna-be politicians would have somewhere to play.

Now, if anyone has anything to say about this, then I will welcome your comments.

:
: Richard (et al.)
:
: Pray tell, what is it that you are doing that
:
: a) You need to encrypt your transmission and
:
: b) You don't want the government to find out what you're sending.

There are many reasons to encrypt transmissions. I, for one, would not want to send company sensitive information over the network. This media is a long way from being secure. If it is encrypted, then industrial spies cannot steal the information.

The problem is, if the government can decrypt the communication, then others are going to be able to get the information to do so as well. I don't care how carefully the government tries to protect the info, which probably will not be very hard - as it certainly would not fall under any "national security" blanket.

There is another problem. Once the communication has been decrypted, the government has the key for that chip - forever. The only way to gain back some privacy is pay the manufacturer for a new chip.

:Perhaps you should rethink your angle on this. If you had a blanket covering a
:bunch of "stuff" in the back seat of your car, wouldn't you expect the local
:authorities to become suspicious? What if you didn't allow them to look
:underneath, even with a warrant?

No, I would not expect them to be suspicious.

You cannot stop the police from searching your car - if they have a warrant. However, I certainly would refuse - if they didn't.

This in not exactly analagous, anyway. Criminals, except for the criminal cops, are not in the habit of stopping cars and searching them - with or without a warrant.

: Please don't get me wrong - I don't particularly like the idea of any
: "backdoor" on encryption. In fact, if the legislation comes up to outlaw
: private encryption, I'll be calling my rep on the hill to voice my opposition.

: All this just makes you sound very suspicious...

Business is not screaming about the Clipper chip because of the possibility
of the government spying. They are complaining for the reason I listed above.

So if these blinded and ignorant apathetic people don't vote then you are
in the group of assholes that voted these people in. OTOH if these sad
and sorry creatures did vote and this is what they got then you are
against the democratic process. You know, the majority rules? Oh wait,
with that kind of apathy, because they don't agree with your hysteria
then they just didn't vote correctly...uhhmmm the way you wanted them too.
I can see clearly now...thanks.

: guess what ..... LASER DOPPLER RADAR. Raytheon may be awarded this project.
Certainly it does. So what? It is not being used for automotive speed
measuring equipment - so your yelling is irrelevant.

: LASER RADAR CAN BE EASILY STEALTHED! ANY CAR CAN BE SET UP to absorb the
: infrared light. or use multi faceted material.

Uh,huh. And, just what are you going to use? Even black does not absorb
most of the infrared. Sure, you can reduce the returned signal - but
that is all. At 200-300 feet, you are not going to be able to reduce
it enough. Remember, unlike doppler shift speed measuring equipment,
the distance to the target does not matter materially.

: Gee Som small Radar Ranges are at 10Watts.

The smallest "Radar Ranges" I have seen are about 300 Watts.

My point was, the ERP does not have much to do with any hazard.

I already responded to this in a previous posting. As I stated there,
your argument is immaterial. I am well aware of doppler laser, it has
been around for about 20 years. It is just that the laser speed measuring
devices do not use doppler, they are Time and Distance, and laser is very
good at measuring distance.

There may be an exception. I think it was Gary C. who stated that the
Georgia police have experimented with doppler laser.

: One could use the kill file feature? But then, might as well stick one's
: head into a hole in the ground and pretend the real problem doesn't exist?

I for one would hate to use the kill feature on Richard. He does post
some good stuff on here related to actual radio listening on occasion.

: I'd rather see Rich's comments, he's trying to incite people to get motivated
: into changing the system for the better, but then again, some people don't
: want to change for fear of losing their status...

Same crap I hear from the bible thumpers knocking on my door on Saturday
mornings.

: BTW, I've been keeping track recently, the number of flames against Richard
: are catching up to his number of posts; who's wasting bandwidth? Perhaps
: attitudes will change when the govt restricts your use of shortwave.

So what you are saying is the number of people asking for an end to this
political bullshit on the .radio forum is becoming equal to one mans post?
Doesn't that tell you anything. I would suspect that many of the readers
here come to these forums to relax and use their hobby as a diversion
from the everday pressures of their lives. Why not start a mail-list for
those that want to be informed of the impending doom and leave this forum
to hobbist. You could even start a rec.radio.legislation.against.us.all
and we could ramble on forever and be right on topic. But then again you
wouldn't beable to elighten the ignorant masses like your brothers the
door to door bible thumpers.

BTW, you mentioned if anyone E-mailed you, you were going to post them
here anyway? How come? Should I post the letters I received from people
that agreed with my opinion of pulling this crap off of here? I won't
because I respect their rights too. They used E-mail for their own reason
and it isn't for me to judge why.

Steve (carmins@dayton.saic.com) wrote:
: For all of you PRO-fanatics out there, I have a (dumb?) reception
: question with which you may be able to help:

: On my PRO34, I receive what sounds (to me) like an unmodulated
: carrier, which slowly (very slowly) rises in frequency, starting at
: approx 150.000MHz, going up to 160.000+ Mhz or so. The change is very
: gradual; I can listen, for instance, to the Co. Sheriff (155.415),
: where the carrier will slowly "rise" to the frequency, interfering with
: the reception of the Sheriff. I can increase the squelch, and this
: works until the carrier keeps the squelch open (full squelch). Then,
: the carrier slowly drifts higher, I can reduce the squelch, and
: everything is ok again - the carrier slowly slides onward up the
: frequency scale.

: I've just started noticing this odd behavior in my PRO34. It does not
: seem to be a " local" problem. Trips to Cincinnati/N. Kentucky (50+
: mi away) show identical "interference".

: Am I just a victim of intermod with this single-conversion scanner? Or
: is my 34 due for replacement?

Well it is getting close to Halloween!! Have you tried sprinkling it with
holy water?? :-0

Sorry. Sounds like a problem with the radio. Have you tried removing the
antenna and seeing if it is still there? If it is you have the problem in
your hand....in the radio in your hand.

: others have this problem too? Any ideas for fixing this?

I have a pager problem with my Pro-43 and Alinco DJ-580 on VHF also. I haven't tried it without the antenna but I did try one thing. Being bored one day I wrapped the little sucker in aluminum foil with just enough of a gap to read the frequency display. Bingo...no more interference from the dreaded pager tower a block away. I put up with the interference because I was afraid the XYL might think it was a potato and throw it on the coals!
